Presidential Election in Colombia: A 180-Degree Turn

In Colombia, the right-wing populist candidate Abelardo de la Espriella won the second round of the presidential election on Sunday, 21 June, which achieved a record voter turnout of 63.4%. Preliminary estimates indicate that he secured 49.7% of the votes, narrowly surpassing left-wing candidate Iván Cepeda, who garnered 48.7% and represented a continuation of the policies of outgoing President Gustavo Petro (2022-2026). This election marks a significant shift to the right for the country, following the lead of Argentina and Chile, now governed by President Javier Milei (since December 2023) and President Antonio Kast (since March 2026), respectively. Meanwhile, Peru is still counting the votes from the second round of the presidential election and may soon follow suit, while Brazil is due to go to the polls in October.

In the financial markets, investors reacted positively to the election outcome. Since 31 May, the date of the first round in which Abelardo de la Espriella topped the poll, the Colombian peso has appreciated by 7.1% against the US dollar, while the average yield on 10-year sovereign bonds has fallen by 150 basis points. Investors have been attracted by the new president's pro-market programme, which promises a clean break with the previous administration. Similar to his Argentinian and Chilean counterparts, he advocates for economic liberalisation and a rapid consolidation of public finances, as Colombia registered one of the largest fiscal deficits in Latin America[1] in 2025.

Economic growth: a rebalancing of growth drivers rather than an acceleration?

Between 2023 and 2025, Colombia's economic growth averaged 1.6% per year, compared to an average of 2.3% in the region. This growth was driven by consumption (+2.2% per year on average), especially government consumption (+3.5% per year). By contrast, investment contracted by 3.6% per year. Consequently, the investment ratio fell from 19.1% of GDP in 2022 to 16.1% of GDP in 2025, marking a twenty-year low.

The economic liberalisation promised by A. de la Espriella could revive private investment by reducing interventionism and the uncertainty that accompanies it. He intends to lift the ban on issuing new licences for hydrocarbon exploration and on hydraulic fracturing (fracking), two measures introduced by G. Petro's administration and aimed at steering the country towards an energy transition. Crude-oil production should therefore rebound after a 1.5% decline since 2022. Goods exports (+0.2% per year on average from 2023 to 2025) are also expected to rise, as hydrocarbons account for 46% of total exports (2022-2025 average).

Consumption growth, however, is likely to slow, at least in the short term. The fiscal austerity programme will significantly impact government consumption (15.7% of GDP in 2025). A. de la Espriella has announced plans to cut 700,000 public-sector jobs (about 3% of the labour force), which the private sector will struggle to absorb. Unemployment is therefore expected to rise in the coming months, following a steady decline over the past two years (from 10.7% in March 2024 to 8.7% in April 2026). The poverty rate, which fell from 36.6% to 28% between 2022 and 2025, thanks in part to several minimum-wage revaluations, could climb again.

Therefore, A. de la Espriella's victory is likely to result in a rebalancing of growth drivers rather than an acceleration of growth[2]. Moreover, downside risks to growth are not negligible. The risk of blockades associated with possible social movements is high, given the electorate's deep polarisation and the new president's controversial socio-economic agenda. His proposals to abolish the Special Jurisdiction for Peace (JEP)—a cornerstone of the 2016 peace accords—and to intensify military operations against drug trafficking could further destabilise an already fragile security situation. The negative impact on the economy could be considerable, particularly in the tourism sector, which has recently emerged as the second-largest source of foreign-exchange receipts behind oil.

[1] See In Latin America, the energy crisis is expected to have a moderate impact on public finances.

[2] In his programme, A. de la Espriella forecasts to lift annual growth to 7% per year.

Public Finances: What will be the extent of fiscal consolidation?

Public finances have deteriorated over the past two years. The central government deficit widened to an average of 6.5% of GDP in 2024-2025, while central government debt reached 64.4% of GDP at the end of 2025, up 5 percentage points (pp) since the end of 2022.

A. de la Espriella has committed to a rapid consolidation of public finances and a return to adherence to the fiscal rule[3] that was suspended in June 2025. According to the CARF[4] (an independent state body), a fiscal adjustment of almost 4pp of GDP will be required by the end of 2027 to bring the fiscal balance back into line with the rule next year. To restore market confidence, the new president has appointed J. M. Restrepo—former Finance Minister under right-wing President Iván Duque—as vice-president.

The first signs of fiscal consolidation could appear as early as Q4 2026. Nevertheless, several obstacles could impede the process. On the expenditure front, the plan to intensify the fight against narcotrafficking could increase security spending. The government's ability to cut other outlays is likely to be limited, as "rigid" expenditures associated with recent reforms (decentralisation, pensions, health) account for over 80% of total spending. On the revenue front, tax receipts could fall if de la Espriella's proposed tax cuts are implemented.

Furthermore, the president may find it difficult to get reforms through Congress, given his outsider status and his rejection of the traditional political elite. Despite the legislative elections in March, Congress remains highly polarised, with the *Pacto Histórico*—the party of G. Petro and I. Cepeda—holding the most seats. Consequently, de la Espriella could struggle to forge the alliances necessary to pass contentious fiscal reforms and budget laws.

In short, A. de la Espriella's victory provides a temporary relief for public finances, helped by lower yields on sovereign bonds. To maintain investor confidence, his administration will need to lay the groundwork for fiscal consolidation quickly. However, numerous hurdles remain, which may contribute to increased volatility in financial markets over the coming months.

Lucas Plé

[3] The rule that sets the fiscal balance target based on the gap between the central government's net debt level, its maximum permissible ceiling (71% of GDP), and its long-term target (55% of GDP).

EDITORIAL

U.S.-IRAN MEMORANDUM OF UNDERSTANDING: TO WHAT EXTENT HAS IT IMPROVED THE ECONOMIC OUTLOOK?

The memorandum of understanding reached between the United States and Iran certainly provides a degree of relief, but it remains shrouded in too much uncertainty to fundamentally change the situation—at least in the short term. The recent fall in oil prices is good news, but it needs to be maintained over the long term, while the reopening of the Strait of Hormuz faces numerous constraints. A return to normal will take time. This headwind to growth is diminishing, which reinforces our resilience scenario. Inflation is likely to remain elevated for some time yet due to the lagged effects of tensions on oil and other commodity prices. The environment therefore remains inflationary, albeit to a lesser extent than before the MoU, but still enough to justify a more restrictive stance from central banks.

The memorandum of understanding (MoU) reached between the United States and Iran, announced on 14 June and signed on 17 June, was generally welcomed by the markets (see tables). Relief was most evident in the oil markets, where oil prices fell sharply. Conversely, the bond markets reacted in a more subdued manner: long-term rates decreased only slightly before rising again by a few basis points in response to the hawkish stance of the FOMC meeting on 16 and 17 June, which also strengthened the U.S. dollar. While there is still limited hindsight, the overall impression is that the MoU has not fundamentally changed the situation compared with what was already priced in by the markets and in our forecasts.

THE SHARP DROP IN OIL PRICES IS UNDOUBTEDLY GOOD NEWS, BUT A RETURN TO NORMAL OIL MARKET CONDITIONS IS STILL A LONG WAY OFF

La The likelihood of the reopening of the Strait of Hormuz has increased significantly, but the outlook remains fragile. Furthermore, this reopening cannot happen immediately due to various technical and logistical challenges. Oil prices continue to be influenced by a precarious balance in the global oil market. Consequently, there is a risk that normalisation may take longer than anticipated, prolonging the associated tensions in oil prices rather than allowing for a swift resolution. Oil prices are unlikely to return to their pre-conflict levels: we consider the USD 75 per barrel mark to be a durable floor and see oil prices stabilizing around USD 85 over the coming quarters[1].

We identify four potential scenarios:

- 1/ The MoU results in a lasting agreement within the next 60 days (which corresponds with our current de-escalation scenario), leading to a Brent price decrease to USD 70/barrel before rising to USD 75 by year-end;

- 2/ The MoU ultimately results in a lasting agreement after one or more extensions: this is our base-case scenario, with Brent falling to USD 70 per barrel and subsequently rising to USD 85 by year-end;

- 3/ The MoU results in an unstable agreement, leading to uneven and unpredictable oil flows through the Strait: the price of a barrel of Brent dips to USD 80 but rises to USD 95 by year-end;

- 4/ The MoU breaks down, causing the Brent price to climb to USD 140/barrel by year-end.

We assign a low probability to scenarios 1 and 4 and a relatively high probability to scenarios 2 and 3, with scenario 2 regarded as our base case.

Reactions to the US-Iran MoU

Sharp drop in energy prices, with more restrained movements in other financial market segments

A CONFIRMATION RATHER THAN AN IMPROVEMENT OF OUR FORECASTS

Signs of an impending resolution to the Iran conflict, thanks to the MoU, emerged slightly earlier than we had anticipated, leading to a faster decline in oil prices. Nevertheless, this more advantageous development does not necessarily mean an improved economic outlook. Our growth forecasts were, in fact, already based on a relatively positive view of the global economic landscape, bolstered by the AI boom and European investment efforts.

1 Reopening of the Strait of Hormuz: the oil market between short-term relief and persisting uncertainties, June 16, 2026.

Our scenario of a resilient global economy has been reinforced. It remains to be seen, now that the risk of a severe escalation of the conflict has lessened, to what extent survey data — which has been visible affected by the shock throughout May [2]— will improve starting in June.

The recent decline in oil prices, in addition to helping temper households' inflation expectations, should mechanically bring down inflation. The key question is how quickly and to what extent. In our view, this is unlikely to signify an immediate end to the inflationary episode. The first-round effects of previous price increases have not yet fully played out, and the downward impact on inflation from the current fall in oil prices is not expected to become apparent for another 3 to 6 months. At the time of writing, oil prices remain above their pre-conflict levels. Furthermore, the repercussions of this conflict have extended beyond a mere shock to energy prices[3]: significant supply chain tensions have reemerged—though not as severe as during the COVID years—and the sharp rise in the New York Fed's composite index did not bode well. The good news is that these tensions should ease as the Strait of Hormuz reopens. However, inflation is likely to remain sustained for some time due to the lagged effects of these tensions. Moreover, heightened demand, driven by lower oil prices, makes the economic environment more conducive to second-round effects. Ultimately, the inflation outlook appears more positive after the agreement than it did before, with inflation going less high, although the improvement is still relatively modest for now. We should not expect a much lower landing point.

FURTHER RATE HIKES REMAIN MORE LIKELY THAN NOT

Does the reduction in inflation risk mean we should shelve the anticipated policy rate hikes for the Fed, the ECB, the BoJ, and the BoE? No, as the inflation risk has merely been reduced: it has not (yet) vanished. The situation for the BoJ is the simplest, as its gradual process of monetary policy normalisation, which predates the energy shock, has every reason to continue. The Fed's scenario is also relatively simple, given that the three rate hikes we project (in December 2026, January, and March 2027) are based on the expected improvement in the labour market, current economic optimism, and core inflation stickiness — not on our assumptions regarding oil prices. At his first FOMC meeting, Kevin Warsh emphasised the significance of maintaining price stability. As for the ECB, recent developments likely rule out the possibility of another rate hike in July. However, a second one in September (which is our base case) remains more likely than maintaining the current rate, influenced by persistently high inflation and strengthening growth. The situation is more uncertain for the BoE, for which the U-turn is greater, as the central bank quits a loosening phase before the shock, to consider now how warranted a tightening is. Any hike will depend on evidence that second-round effects are in the pipeline. We believe such effects are building and the BoE will favour a risk-management approach and opt for a (single) rate hike in September.

Find out more in our scenario and forecasts

ADVANCED ECONOMIES

G7: Back to life. The Evian G7 Leaders' Meeting far succeeded in keeping President Trump engaged for its entire 2-day duration and delivering common statements on no fewer than 9 issues, including greater support for Ukraine and pressure on Russia, the importance of coordinated action to reduce global imbalances (with specific policy changes identified), and securing supply chains for critical minerals. The communiqués are full of references to multilateral institutions, notably IMF, World Bank and OECD but also the WTO. Thus, contrary to premature reports, the G7 is not dead, and neither is multilateral cooperation.

UNITED STATES

United States: Hawkish Fed hold, mixed data. As expected, the FOMC kept interest rates unchanged; but the Committee, now chaired by President Trump's appointee Kevin Warsh, delivered a dramatic shift in outlook, with a shift from 12 members in March expecting a rate cut by year-end, to 9 expecting at least one rate hike and only one expecting a cut (not Warsh, as he declined to submit a forecast). While under Jerome Powell the FOMC and its chair strove never to refer to one side of the Fed's dual mandate without mentioning the other, this time both the statement and the Chair strikingly singled out price stability. Whilst an immediate confrontation between Warsh and the FOMC had been a risk, Warsh was at pains to emphasize the quality and collegiality of the discussions and to praise Fed staff's work. He announced a wide change agenda (notably on communications, balance-sheet policy, inflation frameworks, and data sources), but to be introduced only after 5 expert task-forces have done their work rather than by edict. Data was mixed. Industrial production growth slowed to 0.1% m/m in May (from 0.9% in April), weighed down by a contraction in nondurable manufacturing. However, AI-related, aerospace, and auto sectors expanded. Retail sales ex-autos and gas grew steadily at 0.5% m/m in nominal terms. Housing starts disappointed with a -15.4% m/m fall. The dollar strengthened on the Fed pivot.

EUROZONE

Resilient exports, inflation concerns. Overall Eurozone exports (both intra- and extra-EU) recorded a strong increase in April (+2.5% m/m), with both intra-EU and extra-EU exports rising (+2.4% m/m and +2.6% m/m, respectively). The final inflation estimates confirm May headline at 3.2% (above 3% for the 1st time since 2023) while core accelerated more than expected to 2.6%. Several ECB speakers voiced concern about price increases extending to food and services. Encouragingly for inflation risks going forward, industrial activity remains weaker than at end-2025 despite growing in April (+0.1% m/m and +0.4% y/y), with a rebound in the Netherlands and Ireland offset by flatlining in Germany and France. And basic wage growth (excluding one-off payments), is expected to stabilize at 2.5% in the second half of 2026 and 2.6% on average in 2026, compared to 3.8% in 2025, according to the ECB's wage tracker.

EUROPEAN UNION

Moving forward, cautiously, on China, Banking Regulations and Ukraine. EU Leaders decided to postpone confrontation with China and instead asked the European Commission to "continue engaging in a constructive dialogue", while also developing new tools in the area of trade defence (including tariffs and quotas) and industrial policy, notably to compel corporates to diversify their sources of critical inputs. Importantly, Chancellor Merz joined the hawks' camp, having earlier (at the G7) raised the possibility of countering China's exchange rate weakness with trade measures. On bank regulation, the EBA issued a report proposing a simplification of overlapping capital requirements, which could in some cases result in lowering them, albeit that is explicitly not the goal. In parallel, several media report that the upcoming EC report on bank competitiveness will propose enabling banks to meet liquidity and capital requirements at parent level, which should reduce fragmentation. The report would otherwise fall short of major easing of regulations. Lastly, Ukraine's membership negotiations have officially been launched; however, member states are divided on the speed, with a majority for now favouring a slow pace.

France: Boom in business starts amid forecast confusion. Business starts increased sharply in May 2026 (+15.4% y/y; +12.1% y/y YtD) to reach an all-time high (110000 in May; 3% above the previous peak). The main increases came from information & communication (+68% y/y; +42% y/y YtD) and business services (+27% y/y; +21% y/y YtD). Meanwhile, the Banque de France marked down sharply its growth forecast from 0.9% to 0.5% in 2026 (and 0.9% +0.1pp in 2027). This forecast does not take into account the MoU between the US and Iran, nor, we believe, a number of one-off factors. By contrast, INSEE revised up its Q2 GDP growth forecast from 0.2% q/q to 0.3%, driven by exports (high Airbus deliveries in Q2 after a low Q1); resilient manufacturing (momentum in aeronautics, defense spending / chemicals and oil refineries). The 2026 GDP growth forecast (published for the first time) is 0.7%, with the higher inflation environment expected to have a negative impact on both consumer spending and corporate investment.

Germany: Surge in ZEW expectations and producer prices. The ZEW June survey showed economic expectations surging by 20.7pts to 10.5 – the highest since the start of the Middle East conflict – on war optimism (versus consensus expectations for -6). Banks, insurance, telecoms, IT and utilities saw the largest upgrades in sentiment. Chemicals, automotive, and electronics recovered a little from deep May declines. Construction was the only sector deepening its contraction. Meanwhile, the May PPI rose by +2.2% y/y (vs. +1,7% in April), the fastest level since May 2023, but below expectations. It was mainly driven by higher prices for intermediate goods (+4.2% vs. +2.6% in April) and energy.

Italy: Export strength. The trade balance recorded a surplus of EUR +4.3 million in April, (EUR +9.5 mbillion excluding energy). Exports grew by 8.8% y/y, both for EU and non-EU countries, and imports by 5.5%.

Find out more in our scenario and forecasts

JAPAN

BoJ hike brings rate to highest since 1995. As widely expected, the Bank of Japan raised its policy rate to 1% (up 25bp) at the 15-16 June MPM. Toichiro Asada, the only current board member appointed by PM Takaichi, dissented and preferred to hold. The generally hawkish tone points to another hike by year-end, possibly in October. However, the rate hike did not prevent the JPY from further weakening (USD/JPY at 161.3 on Friday 19, vs. 160.2 on Friday 12). As a result of the interim assessment of the JGB purchase reduction plan, the BoJ announced the end of tapering from Q2 2027. Meanwhile, government support measures help keep inflation below target: In May, Core CPI was steady at 1.4% y/y (in line with expectations).

UNITED KINGDOM

New PM on the way, BOE on hold, and good data. Keir Starmer announced, on Monday 22, his resignation as Prime Minister and leader of the Labour Party. He was facing a leadership crisis since several weeks. The current Greater Manchester Mayor Andy Burnham emerges as the favorite to replace Starmer at both positions by mid-July. Earlier, he won an election to Parliament in a bid to eventually challenge Starmer. The Bank of England's MPC voted 7-2 on 18 June to hold Bank Rate at 3.75% but maintained a somewhat hawkish bias. It slightly lowered its inflation forecasts, though still expects a rise to over 3.25% by year-end 2026 (down from April's 3.7%–3.8%) as energy costs filter through, while marginally improving growth outlook. Inflation held steady at 2.8% y/y in May, unchanged from April and below expectations. PPI showed continued upstream pressure but easing monthly momentum. The unemployment rate fell to 4.9% in the three months to April (from 5.0%), better than expected. But wage growth remained contained and unchanged compared to the previous month at 3.4%. We trimmed our forecast from 2 to 1 BoE rate hike this year, likely in September. The Gfk consumer confidence index held steady in June, and next 12-months improved for the second month running. Retail sales surprised on the upside in May, rising 1.2% m/m both overall and core (i.e.) excluding automotive fuel.

EMERGING ECONOMIES

AFRICA & MIDDLE EAST

Gulf countries: Optimism prevails. The Dubai stock market gained 5.3% during the week and Abu Dhabi 3.1%. Gains were more marginal for Saudi Arabia, which was less affected by the conflict.

Saudi Arabia: Inflation reached+0.2% m/m in May (+1.8% y/y). Currency peg, energy subsidies,[KC3.1] and the flexibility of infrastructures have helped to contain inflationary pressures.

South Africa: Inflation print at +4.5% y/y in May was less than expected (+4.7%). Core inflation rose to 3.8% y/y but remained contained.

ASIA

China: Strong export growth, falling domestic demand. The K-shaped economic growth pattern continues. In May, industrial production growth accelerated slightly to 4.5% y/y from 4.1% in April, supported by solid exports. However, this is much slower than in 2025 (5.9%). Services production growth was also slow, at 4.4% y/y vs. 4.3% in April (5.5% in 2025), and domestic demand was weak. Retail sales value fell by 0.6% y/y, the first decline since China's zero-Covid policy in 2022. Total investment value also contracted (-4.1% y/y), led by the investment fall in real estate, manufacturing and infrastructure. The government may be tempted to increase again fiscal spending in the coming months. Separately, the PBOC launched a yuan repo tool, another step in China's efforts to support greater international use of the RMB.

Indonesia: Policy rate hike. Following a 50bp rate hike at an extraordinary meeting last week, the Central bank raised rates by an additional 25bp to 5.75% on June 18. MSCI has decided to keep Indonesia in the "emerging markets" category. This decision should reassure investors and ease downward pressure on the currency. While the increase in consumer prices remains modest (+3.1% y/y in May), the more pronounced rise in producer prices raises concerns (+5.8% y/y).

EMERGING EUROPE

Czech Republic: Policy rate hike. For the first time in 4 years, the Central bank raised its policy rate by 25 bp to 3.75%. The decision was widely expected, given high nominal wage growth (8.1% y/y in Q1 2026), elevated prices in the housing market and high energy prices. Core inflation remains sticky (2.8% y/y in May). Headline inflation (calculated from HIPC index) has been increasing (1.8% y/y in May from 1.0% in February). More rate hikes are not ruled out this year.

LATIN AMERICA

Policy rate cut to 14.25% (-25 bp). However, inflation remains high (4.7% in May), and the tone of the Central bank's. We now expect the Central bank to adopt a cautious stop-start easing cycle over the rest of the year. Separately, polls point to Brazil resisting Latin America's rightward shift in October's election.

Chile: Central bank on hold. The policy rate was unchanged for the 4th consecutive time. Inflation remains high (3.9% in May after 4.0% in April), but the Board judged that inflationary risks were balanced.

COMMODITIES

The IEA now expects global oil demand to fall by 1.1 mb/d y/y in 2026 (about 0.7 mb/d less than in their May report), while global oil supply is projected to decline by 3.9 mb/j in 2026. In 2027, the supply side is set to recover faster than demand, surging by 8 mb/d, when demand is projected to increase by only 2 mb/d, leading to a supply glut. This surplus should enable countries to replenish their strategic stocks without stressing the oil market.

Stocks have been drawn down heavily to offset the loss of barrels from the Gulf, and OECD government oil inventories have fallen to their lowest level since December 1990. The US Strategic Petroleum Reserve (SPR) dropped by 8.9 mb/d during the week of 12 May, taking it to its lowest level since 1983 (driving total SPR to 340 million barrels).

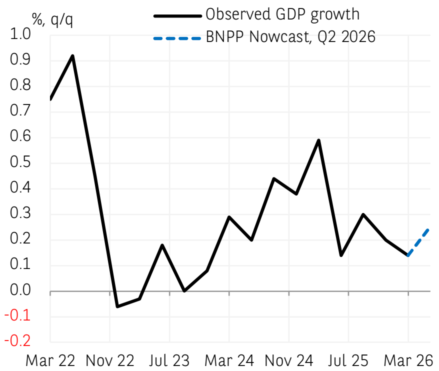
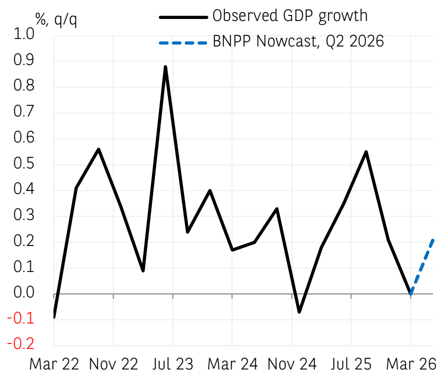
NOWCASTS OF THE ECONOMIC RESEARCH

Eurozone



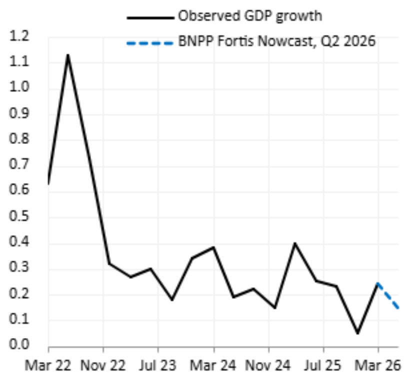
Source: Refinitiv, BNP Paribas

France



Source: Refinitiv, BNP Paribas

Belgium



Source: Refinitiv, BNP Paribas

Our nowcast for Eurozone growth has been revised downward due to the deterioration in confidence surveys (PMI, consumer confidence). It still points to a 0.2% q/q increase in activity in Q2, against a forecast of 0.3% q/q.

Our *nowcast* for French GDP growth suggests a recovery in Q2 2026, at +0.2% q/q, driven by the one-off factors that weighed on Q1 GDP (aeronautics exports and construction output).

Our *nowcast* for Q2 Belgium GDP growth suggests a slight deterioration (0.15% q/q) from Q1. The momentum in the manufacturing sector is proving more resilient than first feared. Costs are rising faster than previously expected, especially in the service sector.

UNITED STATES

The US economy is expected to grow above its potential in 2026, with an average annual growth rate of 2.3%, a yearly improvement (up from 2.1% in 2025). This apparent resilience to energy, uncertainty and tariff and energy shocks, together with above-trend productivity growth, masks K-shaped growth, driven by investment linked to AI-optimism and consumption by the wealthiest amid a wealth effect (historically high stock market valuations). Inflation overshooting is set to continue (3.7% in 2026) at least through 2028, largely because of the rise in oil prices and tariffs – although the impact of these appears to be less significant than expected. The labour market is showing clear signs of improvement that should bring the unemployment rate down toward 4.0%. Given this shift in price and employment risks amid dynamic growth, we expect the FOMC to implement one rate hike (+25pb) and bring the Fed Funds target range at 3.75% - 4.0% by year-end.

CHINA

Economic growth accelerated to +5.0% y/y in Q1 2026, vs. +4.5% in Q4 2025. It stood at 5% in 2025 as a whole and it is expected to slow moderately in 2026. Growth remains characterized by a K-shaped trajectory. On the one hand, exports are still dynamic, and Chinese goods are likely to remain competitive in the short term. On the other hand, domestic demand remains sluggish. It rebounded in the first two months of 2026 but has weakened significantly since March. The crisis in the property sector continues and confidence of households and private investors remains low. The authorities will maintain supportive fiscal and monetary policies, but their measures may continue to be modest, even in a less supportive global environment. Deflationary pressures are expected to decline in 2026, notably thanks to higher global energy prices and anti-involution measures implemented by the authorities.

EUROZONE

Eurozone growth would slow in 2026 due to spillovers from the Middle East conflict. In Q1 2026, GDP growth contracted 0.2% q/q mainly due to the volatility of Ireland's GDP data, but growth in the rest of the Eurozone remained resilient (+0.2% q/q). In 2026, consumption would be held back by falling real wages. GDP growth, which reached 1.5% in 2025, would slow down to 0.6% in 2026, before rebounding at 1.6% in 2027, while inflation would rebound to 3.0% in 2026 and 3.3% in 2027 (compared to 2.1% in 2025). Activity would nevertheless withstand the energy shock, supported by investment in defence, AI, and electrification, which should continue to boost intra-EU trade. As inflation rebounds, two 25-basis-point hikes in the ECB's policy rate would take place in 2026 – with the first hike expected in June – pushing the deposit facility rate to 2.5%. As inflation rebounds, another 25-basis-point hikes in the ECB's policy rate – following June's increase – would take place in Q3 2026 pushing the deposit facility rate to 2.5%.

FRANCE

GDP growth deteriorated to -0.1% q/q in Q1 (after 0.2% q/q in Q4) as a result of one-off factors, including low aeronautics exports (-20% q/q despite an increase of the output) and construction output (-1.5% q/q). From Q2 2026, growth should be affected by the impact of higher oil prices on inflation (2.4% in 2026, after 1% in 2025) and household purchasing power (with a likely impact on their consumption). In 2026, GDP growth should reach 0.8% in 2026 (after 0.9% in 2025), driven by public spending and private investment in AI. Higher inflation (2.2% in 2026, after 1% in 2025) would weigh on GDP growth.

UNITED KINGDOM

Economic activity is expected to slow in 2026, with growth decelerating to 1% from 1.4% in 2025; following +0.4% q/q in Q1, growth dipped to -0.1% m/m in April, bringing the average quarterly pace for the remainder of the year down to approximately +0.1%. This slowdown is set against a backdrop of renewed inflationary pressures triggered by the war in Iran: inflation is projected to reach 3.4% y/y, and to remain sticky and well above BoE's target at +3.3% in 2027. In this context, and contrary to the initially envisaged easing scenario, monetary policy would shift toward a 25bp rate hike in H2 2026. 10y gilt yields will remain elevated in 2026, before falling to 4.30% in 2027 on reduced net supply, a decline in political risk premia and a market starting to eye BoE rate cuts.

JAPAN

The energy shock is set to impact the strong momentum of the Japanese economy negatively. We expect annual GDP growth to stand at 0.5% in 2026, down from 1.1% in 2025. Higher inflation and production costs are expected to weigh on the economy's overall performance. On the other hand, the latter is still tempered by structural supply constraints and supported by fiscal policy and wage growth. Inflation has generally overshot the 2% y/y target since 2022 and is expected to stay there through at least 2028. Accordingly, the Bank of Japan initiated a process of "adjustment in the degree of monetary accommodation" in 2024, lifting the policy rate to 1.0% so far (previously negative) – the highest since 1995. We expect the process to extend, including one hike (25pb) in H2 2026, until a 2.0% terminal rate in end-2027. Japan is facing long-term rates pressure, illustrated by historically high 10- and 30-year yields, probably fueled by the level of public debt and the pace of monetary adjustment.

EXCHANGE RATES

In our base-case scenario (gradual normalisation of the Middle East situation with persistent price tensions), we expect the USD depreciation against the EUR to resume, albeit very gradually, amid broader diversification away from the dollar. We forecast EUR/USD to reach 1.21 by Q4 2026 and 1.25 by Q4 2027. We anticipate stabilisation of the yen and the GBP against the dollar in 2026 (USD/JPY 160 and GBP/USD 1.35 by Q4 2026) and 2027.

UNITED STATES: A DROP OF OIL IN THE TREASURIES MARKET'S GEARS

Céline Choulet

The US regulatory framework is becoming more favourable to intermediation conditions within the US Treasuries market. The easing of leverage requirements has enabled the largest banks, known as Global Systemically Important Banks, or G-SIBs, to fulfil their role as intermediaries during the first months of the year. The ongoing reassessment of the G-SIB capital surcharge calculation method could also benefit market liquidity. However, the capacity of large US banks to absorb federal debt is expected to remain limited.

THE LEVERAGE STANDARD ONCE AGAIN ACTS AS A BACKSTOP

In 2025, the need to recalibrate the enhanced Supplementary Leverage Ratio (eSLR) imposed on Global Systemically Important Banks (G-SIBs) became a priority for US regulators[1]. The constraints on balance sheets were, in fact, on the verge of becoming more binding than the risk-weighted capital requirements (*see box*). It risked preventing, or even discouraging, certain major banks from fulfilling their role as intermediaries in the Treasury market. This was an undesirable situation under normal circumstances and even more so during periods of stress.

Last November[2], the enhanced Supplementary Leverage Ratio (eSLR) requirement was aligned with the Basel recommendation, set at 3% plus a buffer equal to 50% of the G-SIB surcharge calculated according to the Financial Stability Board's Method, referred to as "Method 1" in the US regulatory framework[3]. The effective date of this new eSLR ru le was set for 1 April 2026 (the legal deadline). However, due to the introduction of a relaxation, banks were permitted to apply it early, starting on 1 January 2026. Under the new formula, the eSLR requirements for the eight largest US banks (the G-SIBs) now range from 3.5% to 4.25%, compared to the previous uniform requirement of 5%. The buffer imposed on their depository institution subsidiaries (in addition to the basic 3% requirement) has been capped at 1%, ensuring that their eSLR requirements cannot exceed 4%. This places them within a range of 3.5% to 4%, down from the previous uniform requirement of 6%.

The eSLR requirement for the eight GSIBs is now less binding than their riskweighted requirements (Chart 1, left-hand panel). In other words, the amount of Tier 1 capital needed to satisfy the eSLR is lower than that required by the riskweighted requirement. At the consolidated level, this allows every GSIB to increase its balance sheet in favour of riskfree assets without the need to raise additional Tier 1 capital. Consequently, the eSLR requirement is no longer considered "binding".

A MORE FLEXIBLE REGULATION IN FAVOUR OF TREASURY MARKET LIQUIDITY

The relaxed leverage requirements achieved the outcome regulators had hoped for: intermediation conditions in the Treasury market improved during the first months of the year. Against a backdrop of heightened uncertainty due to the Iran conflict, major banks were able to absorb a portion of Treasuries that had no buyers. This is reflected in the rising net positions of primary dealers, predominantly GSIB subsidiaries, which reached 1.8% of the outstanding federal debt in March and April, the highest level since the 2008 financial crisis (Chart 2).

Definitions of capital requirement

Banks are subject to various capital requirements; some rules are risk-weighted, while others are not.

The risk-weighted Tier 1 requirement compels banks to mobilise sufficient core capital based on the risks (credit, counterparty, market and operational risks) associated with their exposures. The Tier 1 capital ratio is the ratio of Tier 1 capital to risk-weighted assets.

Conversely, the leverage requirements are non-risk-weighted capital requirements. Their purpose is to ensure that a bank's assets or commitments, regardless of the risks associated with them, do not exceed a specific multiple of its capital. As a result, US Treasury securities, although considered «safe» assets with a zero risk-weighting for risk-weighted capital ratio calculations, are fully accounted for in the exposure calculations (the denominator of leverage ratios) just like any other asset, including those that are highly risky. A leverage ratio limits the size of bank balance sheets. Its calibration should enable it to function as an extreme limit (safety net) rather than a permanent constraint. Otherwise, it could become the decisive factor in portfolio choices, incentivising banks to favour riskier, more capital-intensive, yet more profitable assets.

All US banking institutions are subject to a simple leverage requirement (Leverage Ratio, LR), which compares Tier 1 capital to average on-balance sheet assets. The largest banks (those with consolidated assets exceeding USD 250 bn or with at least USD 75 bn in non-bank assets, short-term market debt, or off-balance-sheet exposures) and their depository institution subsidiaries are also subject to the Basel leverage rule (Supplementary Leverage Ratio, or SLR). This rule compares Tier 1 capital to leverage exposure, which includes all on-balance-sheet assets (in accordance with applicable accounting rules, excluding derivatives and securities financing transactions recorded at gross value) and a reduced measure of off-balance-sheet commitments. The SLR requirement for the eight G-SIBs is stricter and is referred to as the enhanced Supplementary Leverage Ratio (eSLR).

1 See The US Treasuries market, an idol with feet of clay: Oiling the wheels.
2 Federal Reserve Board - Agencies issue final rule to modify certain regulatory capital standards.
3 In the United States, the capital surcharge imposed on GSIBs is determined using two methods: the Financial Stability Board's approach ("Method 1") and the Federal Reserve's approach ("Method 2"). The more stringent of the two (typically Method 2) is used to set the overall riskweighted capital requirement. The outcome of Method 1 is now used to set the eSLR requirement.

The leverage ratio eSLR is once again acting as a backstop for the 8 G-SIBs | **... but remains binding for their major deposit-taking subsidiaries**

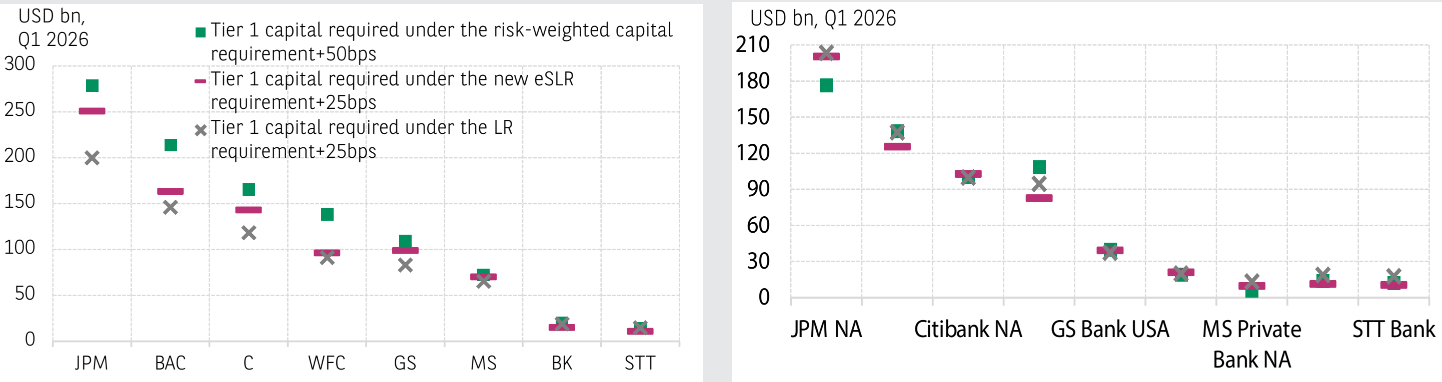

CHART 1

SOURCE: FINANCIAL REPORTS, S&P CAPITAL IQ, BNP PARIBAS

The chart shows the Tier 1 capital amounts required to meet various solvency benchmarks. Left-hand panel: for the eight G SIBs, the risk weighted Tier 1 requirement (plus a 50 basis point safety margin) is stricter than the leverage standards LR and eSLR (both plus a 25 basis point safety margin). The eSLR leverage standard is more binding than the LR leverage standard for six of the eight G SIBs. Right-hand panel: with the exception of Wells Fargo Bank NA, the major deposit-taking subsidiaries of the G SIBs are mainly constrained by leverage standards. The eSLR standard exceeds the risk weighted T1 requirement for four of the nine major subsidiaries and is practically equivalent for three others. The LR standard is more binding than the eSLR standard for six subsidiaries and slightly less binding for the remaining three.

Primary dealers' Treasury inventories reach their highest level since 2008

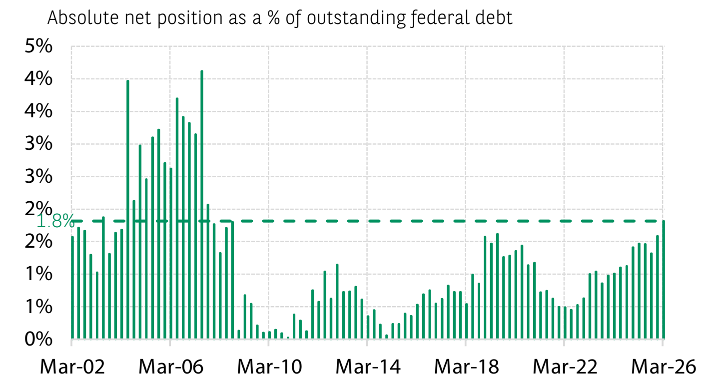

CHART 2

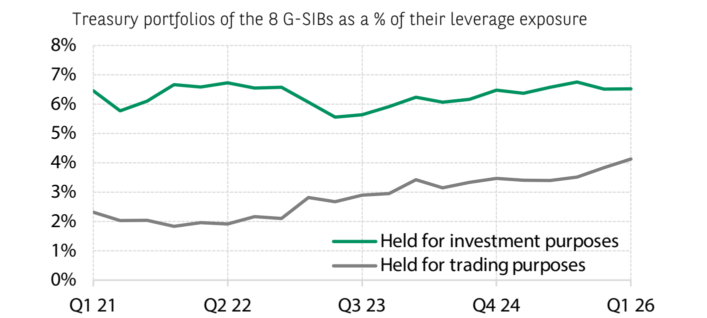
SOURCE: FEDERAL RESERVE BANK OF NEW YORK, BNP PARIBAS

The relaxation of the eSLR requirement has not sparked a significant increase in Treasury purchases



Leverage exposure is a proxy for a bank's total assets and commitments, used as the denominator in the Basel leverage ratio (SLR and eSLR in the US)

CHART 3

SOURCE: S&P CAPITAL IQ, BNP PARIBAS

This increase is particularly significant as, from midDecember to mid-April, the Federal Reserve (Fed) absorbed a substantial share of new Tbill issuance, contrasting with the periods of 2014–2019 and 2022–2025 when the Fed was reducing its holdings. With the Federal Reserve Management Purchases and Treasury buybacks programmes in place, the relaxation of the leverage standard helped preserve Treasury market liquidity and contributed to more favourable conditions in the repurchase agreement (repo) markets.

FEDERAL DEBT ABSORPTION CAPACITY REMAINS LIMITED

The relaxation of the eSLR requirement has not resulted in the anticipated increase in demand for these securities. Admittedly, GSIB trading portfolios, which contain positions booked by brokerdealer subsidiaries, have grown (averaging 4.13% of leverage exposure in Q1 2026, up from 3.54% in 2025), yet their Treasury investment portfolios (held-to-maturity or available-for-sale) have remained virtually unchanged[4] (6.52% compared with 6.55%; Chart 3). Various limitations[5] have prevented the stimulus hoped for by the Treasury Secretary, including the eSLR itself.

4 With the exception of JPMorgan and Goldman Sachs
5 Large-scale outright purchases would have resulted in an increase in GSIB surcharges by enlarging the size indicator and worsened simple leverage and eSLR ratios (which continue to be binding for some depository institution subsidiaries). These acquisitions would also have heightened banks' maturity-transformation and interest-rate risk exposures or breached internal market-risk exposure limits.

For seven of the nine large GSIB depository institution subsidiaries, the standard continues to be binding—or nearly so (Chart 1, right-hand panel). Yet, the Treasury investment portfolios of major banks are, for the most part, recorded on the balance sheets of their deposit-taking subsidiaries.

THE PROPOSED REFORM TO GSIB CAPITAL SURCHARGES COULD LIKEWISE PROVIDE SOME MOMENTUM

Market-making requires maintaining extensive inventories of securities and executing numerous repo (and reverserepo) transactions. This tends to inflate leverage ratios at dealer parent companies by enlarging their balance sheets, while also exacerbating their systemic risk scores (due to increased size, shortterm wholesale funding, and complexity indicators). These scores are critical in determining the capital surcharges levied on large banks (the GSIB surcharges).

The Federal Reserve has recently proposed revisions to its methodology[6]. It plans to reassess all the coefficients in its formula (to account for economic growth and inflation), reduce the weight of the short-term wholesale funding indicator, introduce narrower surcharge brackets (to mitigate threshold effects), and calculate positions based on annual average data rather than end-of-period data. These adjustments should give GSIBs greater flexibility in their intermediary activities and positively impact Treasury market liquidity. They will relieve balance-sheet pressure by reducing both the level and growth rate of surcharges. They should also smooth liquidity supply over the year and reduce repo rate fluctuations around balance-sheet reporting dates.

Nevertheless, this reform is unlikely to trigger large-scale Treasury purchases. On the one hand, leverage standards LR and eSLR are expected to remain binding for most GSIB deposit-taking subsidiaries. On the other, the proposed relaxation of risk-weighted capital rules could reverse the prevailing hierarchy of capital requirements, pushing the leverage standard back to a "binding" status on a consolidated basis[7] and deterring large banks from acting as market-makers.

The expanding scope of centralised clearing for Treasury repo transactions would undoubtedly improve market liquidity. However, unless the federal debt trajectory is more effectively managed, US authorities may feel compelled to continue using tools to maintain the role of dealers in the Treasury market.

Céline Choulet

Completed on 13 June 2026

6 Federal Register: Regulatory Capital Rule (Regulation Q): Risk-Based Capital Surcharges for Global Systemically Important Bank Holding Companies; Systemic Risk Report (FR Y-15). The proposal is open for comment until 18 June.
7 For context, the capital surcharge for US GSIBs is determined by "Method 2" (currently under review), whereas the buffer used to calibrate the eSLR requirement is based on "Method 1", which is less stringent but remains unchanged.

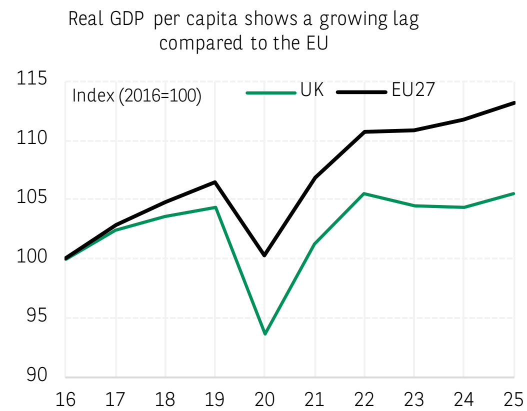
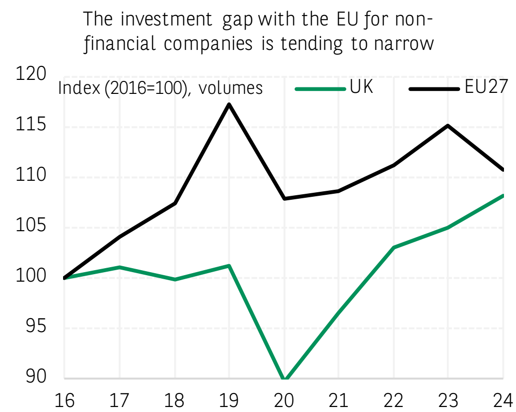
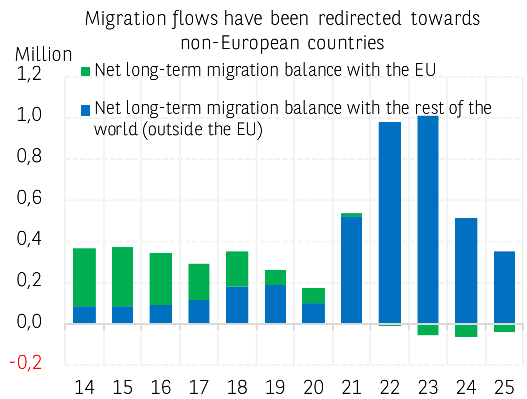
A DECADE AFTER THE REFERENDUM, THE UK IS FACING THE CONSEQUENCES OF BREXIT

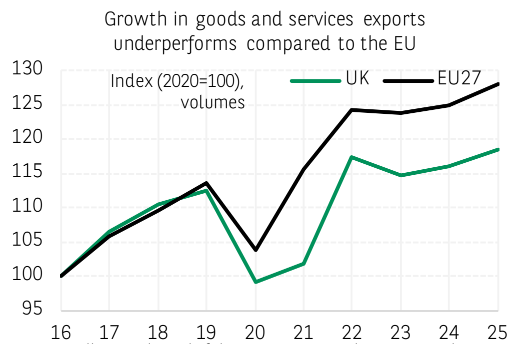
Marianne Mueller

23 June will mark the tenth anniversary of the Brexit referendum, which led to the UK's official exit from the European Union on 31 January 2020 (followed by a transition period). Since then, the country has indeed regained control over certain policy domains, such as trade, migration and regulatory frameworks. However, both the anticipation of Brexit and its actual implementation in 2021 have been linked to a decline in the country's performance across several key indicators. Against a backdrop of escalating geopolitical tensions and mounting shared challenges, the UK is now seeking to re-establish practical collaboration with its main economic partner: the European Union.









Notes: Following the end of the transition period on 31 December 2020, the trade agreement between the two parties entered into force on 1 January 2021.

SOURCE: ONS, OECD, EUROSTAT, BNP PARIBAS

An imperfect Brexit

While the referendum enabled the United Kingdom to regain exclusive competence over several areas of governance, this restored sovereignty has not resulted in a clean break with the European Union. Furthermore, it has led to developments that deviate from initial expectations.

In terms of trade, the United Kingdom has negotiated new free trade agreements with Japan (2021), Australia and New Zealand (2023), before joining the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP, 2024). However, the momentum of UK exports has waned, lagging behind that of the EU (Chart4). Furthermore, while the volume of UK goods exported to the EU has fallen (-14% between 2019 and 2025), the EU continues to be the country's largest trading partner, accounting for around 41% of its goods and services exports, underscoring the significance of geographical proximity in international trade.

The situation is similar from a regulatory perspective

The UK has carved out its own path in targeted sectors – most notably through the Edinburgh Reforms aimed at financial and banking services, as well as a more flexible regulatory framework for artificial intelligence compared to that of the EU. However, aside from these initiatives, the overall divergence in regulation remains limited: only a third of the 6,800 European texts that were incorporated into UK law have been amended or repealed. With the exceptional framework (REUL Act) expiring on 23 June, any future amendments will have to follow the standard parliamentary procedure, which is longer and more restrictive, likely slowing the pace of divergence from European standards.

Finally, regarding immigration, the desire to regain control over borders has been achieved through the introduction of a points-based immigration system and the end of free movement for Europeans within the UK. Consequently, the net migration balance from the EU plummeted following the referendum, becoming negative by 2022. However, this new system has not led to an overall reduction in immigration. In fact, immigration from non-EU countries increased massively (with total net migration reaching a record high in 2023), before a tightening of regulations led to a decline in 2025, though remaining above pre-Brexit levels (Chart3). Thus, the UK has regained control over migration channels yet has not reduced total migration flows.

A significant economic cost

In 2018, the Office for Budget Responsibility (OBR) projected a 4% decrease in productivity and a 15% reduction in trade over the long term – projections it then reaffirmed in 2024. These figures are corroborated by an NBER study (2025), which found that the UK's GDP is currently 6-8% lower than it would have been had the UK not left the EU. The same study revealed that investment, employment and productivity levels are also lower than they would have been without Brexit, with investment shortfalls ranging from -12% to -18%, and employment and productivity deficits between -3% and -4%. This trend is illustrated by the disparity in real GDP between the UK and the EU27 (Chart1), as well as the growth rates of exports (+3.8%) and imports (+4.9%) between 2021 and 2025, which lag behind those of similar economies (Chart4). As a result, uncertainty and trade barriers have had measurable effects on growth.

The UK still benefits from structural advantages that existed prior to Brexit and remain relevant

The effects of Brexit differ across various sectors and regions. The UK remains an attractive destination for foreign direct investment, especially in financial services, technology and artificial intelligence. This is largely due to more flexible regulations in these sectors compared to the EU (a flexibility that existed prior to Brexit and has since been further enhanced, particularly regarding prudential regulations), a deliberately pro-innovation government policy (evidenced by the AI Opportunities Action Plan and the regulatory sandbox), as well as inherent structural strengths (the robustness of its financial and technological ecosystems, its skilled workforce, and its language and time zone advantages, which facilitate bridges to North American and Asian markets).

This combination of factors has supported business investment (Chart2), the only area where the UK has managed in recent years to partially close the gap that had opened with the EU (while the Draghi report highlighted that excessive regulation has penalized such investment within the EU).

A strategic pivot toward the European Union

The UK is now seeking a rapprochement with the European Union. The bilateral summit on 19 May 2025, the first since Brexit, culminated in a joint declaration, a security and defence partnership, and a roadmap aimed at strengthening cooperation in several areas. Concrete progress has already been made, such as the extension of the fisheries agreement, discussions on the alignment of carbon markets, and a proposal for a common sanitary and phytosanitary area (with dynamic regulatory adjustments) to remove trade barriers in this sector. Furthermore, the UK is currently negotiating for broader access to specific European programmes as a third country, notably the SAFE defence fund and the European Industrial Accelerator Act. The forthcoming bilateral summit, to be held on 22 July, should help to advance these discussions. This strategic shift is a response to an increasingly challenging international environment, characterised by escalating geopolitical tensions, heightened economic rivalries, and energy and climate issues. It would also help to ease the economic friction caused by Brexit, capitalising on the fact that the majority of the British public is now dissatisfied with Brexit and largely in favour of the country rejoining the EU.

EDITORIAL

THE FED UNDER PRESSURE: A TEST WITH GLOBAL STAKES

The independence of the Federal Reserve (Fed) has been challenged by the US administration, but it remains intact. As the Kevin Warsh era begins with the 16-17 June FOMC meeting, the simultaneous strength of inflation and the labour market set the stage – should it persist, as we anticipate – for monetary tightening to start by the end of the year. Yet the turbulence at the end of Jerome Powell's term is a reminder that central bank independence is not a given. The stakes go beyond price stability alone and extend to the global financial architecture itself.

Since returning to the White House, Donald J. Trump has not spared the Fed, openly criticizing its former Chair, Jerome Powell, for rate cuts deemed insufficient and, in the process, exerting explicit and sustained pressure on the central bank's independence. The former Fed Chair — but still an FOMC member — has even described the episode as a "stress test", that is, resilience probed under heavy pressure. Initially verbal, the pressure shifted onto administrative and legal ground: first in August 2025, against Governor Lisa Cook, then in January 2026, with proceedings aimed at Powell himself over the renovation of the Fed's headquarters.

For now, the Fed is passing the test, and it should continue to act independently. The judicial rulings handed down so far have generally favored the institution's autonomy from the executive[1]. The Fed's internal culture has also played a role, not only in keeping Cook on the board. The FOMC has stayed on the course, keeping an approach dictated by the data and the economy outlook. It held the policy rate through the first half of 2025, when the effects of the additional tariffs on inflation were not yet known. And it eased in the second half of the year because the labour market was weakening, not because of political pressure. Dissent was voiced, admittedly more frequent than usual, but Powell's legitimacy was never called into question.

CHAIRMAN AND FED FUNDS: A TWOFOLD CHANGE OF DIRECTION

Warsh's arrival at the head of the FOMC should not, in itself, change the situation. We expect monetary policy to continue aligning with the dual mandate and to be driven by economic conditions. The committee's voting structure is the first safeguard, not least in fixing the Fed Funds target range. Warsh's vote does not carry more weight than any other governor's or voting regional Fed president's — and the latter generally appear concerned by the elevated and growing level of inflation.

Furthermore, Kevin Warsh's track record and public positions do not suggest much appetite for instrumentalizing the central bank for political or fiscal ends. His first departure from the Board of Governors (2011) stemmed from a disagreement on quantitative easing (QE), and he reiterated his critical view of the use of the Fed's balance sheet at his confirmation hearing before the Senate Banking Committee. In his view, the size of the balance sheet has become "an ordinary recurring force", diverted from his purpose as an instrument used "in times of emergencies". Warsh therefore considers that this tool has become "unhelpful" in "achieving the dual mandate" and that shrinking it is imperative.

In recent months, the Fed had leaned towards the risks surrounding the maximum employment objective, while inflation remained above-target but was edging closer to it. With inflation having resumed an upward path and employment concerns having receded, the FOMC should now rebalance its stance. Although driven by energy prices, the combination of that inflationary dynamic with a rebounding labour market and still-strong growth cannot be ignored by the Fed. Governors Waller and Bowman have each acknowledged, to differing degrees, that their earlier dovish stance no longer holds. The debate is thus no longer about whether rate cuts are warranted, and the Fed's next move should be upward. That is our call — a first 25bp hike in December, followed by two more, in January and March 2027, taking the target range to 4.25%-4.5%. These three increases would reserve the three insurance cuts implemented in 2025 in the face of labour-market risks that have since faded.

INDEPENDENCE: A FRAGILE CONSENSUS

The pressure on the Fed is a live reminder that the independence of advanced economies central banks is never settled for good. It earned its legitimacy through the empirical demonstration of its effectiveness, most visibly in bringing the inflation of the 1970s to an end. It is written into law, too: the Federal Reserve Act in the United States, the Maastricht Treaty for the European Central Bank (ECB). But ultimately it rests on a continuous consensus among all relevant actors: the executive, the legislature, markets and the general public.

For political executives, there is a line between a natural preference for low rates to support growth and limit the cost of debt, and a more problematic slide into "fiscal dominance", whereby monetary policy becomes subordinate to fiscal policy. The former can no longer focus solely and independently on controlling inflation or maximizing employment. The US president's criticism of Powell sits within this framework: it targeted rates he judged too high, detrimental to growth and to the cost of servicing the federal debt.

The case of the Bank of Japan (BoJ) is an interesting example of blurred lines: independence is legally guaranteed yet is bound by coordination with the Ministry of Finances. During the 2010s, the BoJ rolled out unconventional tools on a scale never seen before, aimed at supporting the government's "reflationist" agenda. This took shape in 2013 with massive asset purchases (Quantitative and Qualitative Easing, QQE), before the yield curve control (YCC) was introduced in 2016. The scale of the interventions has pushed the BoJ's balance sheet beyond 100% of GDP, which can be associated with the emergence of a *de facto* fiscal dominance. While endemic deflation justified the support at the time, the exit from this extremely accommodative policy is now proving complicated. It is complex for the government, whose debt-servicing costs grow as sovereign yields rise and whose bond issuance must be absorbed more by the market and less by the BoJ, which is scaling back its purchases. And it is equally complex for the BoJ, which must move cautiously in normalizing its monetary policy, as it must raise rates sufficiently to counter inflation, but neither too much nor too fast, in order to contain the rise in long-term rates.

1 The Trump vs. Cook case, however, has not yet been decided by the Supreme Court, and the Department of Justice's (DoJ) dropping of charges against Jerome Powell did not, in his view, proceed with the expected 'transparency and finality,' which is why he remains a member of the Board of Governors."

CENTRAL BANK CREDIBILITY: BEYOND INFLATION, A SHARED CONCERN

Central bank's primary role is to ensure price stability, even if differences may exist regarding the targets and the wording of their mandate. The ECB is prioritizing inflation[2], whereas the Fed runs a more explicit dual mandate (price stability and maximum employment). Any threat to their independence would compromise those goals, since the proper anchoring of household, corporate and market inflation expectations is based on the credibility of central banks' commitment to their mandate.

Furthermore, the central banks' status, embodied in their independence and credibility, is a pillar of the financial architecture of advanced economies and, increasingly, that of emerging economies. In the United States, it underpins the dollar's role as a reserve currency and the central position of Treasuries as the risk-free asset. The country is thereby able to finance its imbalances on more favorable terms than the size and trajectory of its government debt would probably warrant. The reasoning extends beyond the United States — by analogy, and by contagion. Japanese, German, and British government bonds likewise benefit, albeit to a lesser extent, from a privileged status tied to the credibility of their signature, to which their respective central banks are no strangers. The ultimate risk is a generalized rise in interest rates.

Since the start of 2025, we have seen an illustration of how markets could be rattled by Donald Trump's threat to the Fed's independence. These tensions were initially acute, then more contained[3]. Kevin Warsh will have to steer through those same waters, and the likeliest outcome is that he holds course. Were he to decide otherwise, he would face major opposition within the FOMC, which would weigh on his own credibility. In addition, being outvoted would undermine his objective of institutional changes, on which he hopes to leave his mark at the Fed: a smaller balance sheet and reshaping the institution's style and cadence of communication. And if he was to lose the control of inflation, his legacy would echo that of Arthur Burns — it is certainly not how he wants to be remembered.

In his first speech as a former Fed Chair, Powell declared: "Our credibility has been built and sustained over many decades, and we have a duty to safeguard that priceless asset for our fellow citizens and for generations to come." The statement concerns the Fed, but it holds equally for every independent central bank. Calling these principles into question would carry such costs that it appears, rationally, unlikely. In the end, the safest way for central banks to preserve their independence is to honor their mandate.

Anis Bensaidani
anis.bensaidani@bnpparibas.com

2 The Treaty also requires the ECB to support the economic policies of the European Union once the price stability objective is achieved – and without prejudice to that objective.

3 In April 2025, President Trump's ambiguous remarks about ending Powell's "termination which cannot come fast enough" triggered a sharp sell-off across equity and bond markets. Market reactions were less pronounced when Governor L. Cook faced an attempt to remove her (August 2025) and when the Department of Justice's (DoJ) subpoenas served to Jerome Powell were publicly disclosed by the latter.

Find out more in our scenario and forecasts

ADVANCED ECONOMIES

UNITED STATES

Inflation hits multi-year highs, but consumer sentiment stabilises. In May, CPI headline rose to 4.2% y/y (up 0.4pp m/m), in line with expectations but the fastest pace since March 2023. It was driven largely by energy prices (up 40.6% y/y). Core CPI rose to 2.9% y/y, up 0.1pp with the monthly increase (0.2% m/m) softer than expected thanks to a decline in core goods inflation. Meanwhile, producer prices surged – the PPI index rose to 6.5% y/y (up 0.8pp), well above consensus, and its highest reading since 2022. The PPI index excluding food, energy, and trade services was particularly strong too, at 5.1% y/y (up 0.7pp), suggesting further inflationary pressures to come to retail prices and mechanically increasing core PCE inflation (the Fed's preferred target), which we expect will accelerate to 0.4% m/m (from 0.2 in April) and 3.4% y/y. Separately, in June, the University of Michigan's consumer sentiment index rose by 4.1 pts, breaking a 3-month streak of decreases, albeit it remains historically low and below the pre-war level. Inflation expectations edged down at 1-year (-0.2pp to 4.6%) and 5-10 year (-0.5pp to 3.4%). This week's FOMC meeting will be the first chaired by Kevin Warsh. We expect the Committee to drop its easing bias, meaning the next move could be a hike as well as a cut.

EUROPEAN UNION

Progress in trade and defence despite setbacks. China abruptly cancelled a high-level EU-China meeting due to take place later this month. The EU has signed two separate trade agreements with South Korea and four African nations (Comoros, Madagascar, Mauritius, and Seychelles), both covering services among others. The EU has approved measures to simplify and accelerate defence procurement, including faster permit decisions (42-day deadline), easier cross-border transfers of defence products, and streamlined access to the European Defence Fund. The reforms address industry demands for reduced bureaucracy and clearer regulations, aligning with the 2030 defence strategy. Less positively, German Chancellor Merz officially pulled the plug on FCAS (the Franco-German-Spanish joint advanced fighter jet project).

France. Inflation spreads to construction. Construction producer prices increased by 3.5% y/y in April (vs. 2.3% in February) for buildings and 7.3% y/y in April (0% in February) for civil engineering.

Germany. Construction rebound amid tepid growth. Industrial production hit its highest level since December 2025 in April, rising +0.4% m/m, and the first positive print since the Middle East conflict began. The primary driver was construction, which reached its highest level since March 2024. April manufacturing output was flat against March, reducing the y/y decline (-1.8% in April vs. -4.9% in March). Imports surged to their highest level since November 2022: +2.8% y/y YTD. The Bundesbank on Friday downgraded Germany's 2026 GDP growth forecast to 0.5% (vs. 0.8% according to our forecasts), with GDP expected to stagnate in Q2 before a slight Q3 recovery. The 2027 forecast was cut to 0.8%, while 2028 was raised to 1.4% on the back of fiscal stimulus. Inflation forecasts were revised upward. German company insolvencies rose 16.1% y/y in March, a sharp acceleration from near-flat readings in January and February.

EUROZONE

ECB hikes policy rates by 25bps. The decision to raise the deposit facility rate to 2.25% was expected and unanimous. Being the first major central bank to raise interest rates and facing criticisms of policy mistake, President Lagarde stressed that the decision was not an insurance hike but a necessary step that was "robust across all scenarios" and that no alternative proposals were discussed in the meeting. The ECB president reaffirmed that decisions will be made on a meeting-by-meeting basis, based on available data, without a pre-set rate trajectory. The ECB now expects headline inflation to rise to 3.0% in 2026 (up from 2.6%) and 2.3% in 2027 (up from 2.0%). We expect greater stickiness. The ECB's downward revisions to GDP growth projections were more subdued (-0.1pp for both 2026 and 2027, to 0.8% and 1.2%, respectively). We expect another rate hike, most likely in September. Italian Deputy Prime Minister Antonio Tajani publicly criticized the ECB's rate hike, saying it "doesn't help anyone" and arguing that credit access should be made easier even in difficult times.

JAPAN

Higher producer-price inflation. In May, the PPI index stood at 6.3% y/y (up 1.0pp, consensus: 5.5%) amid higher energy prices compounded by a weak-JPY. It gives the BoJ an additional reason to raise its policy rate to 1% this week. Markets will be attentive to hints about the pace of additional rate hikes, as the yen remains under pressure owing to perceptions that the BoJ is behind the curve in normalizing policy

UNITED KINGDOM

Stagflation vibes require BOE balancing act. GDP contracted for the first time in eight months in April. Permanent staff placements dropped the most in 10 months in May (REC/KPMG survey) and potential layoff notices surged to over 37,000 in the four weeks to May 24 — up 62% y/y and the highest since 2020. More positively, like-for-like retail sales rose 3.4% y/y in May, a sharp reversal from -3.4% in April. The BOE's quarterly Inflation Attitudes Survey showed UK households expect inflation to reach 4% over the next year — up from 3.2% in February and the highest reading since November 2022. Longer-term expectations also rose. Separately, a BOE Decision Maker Panel survey showed firms plan to raise prices by 4% in the coming year, the highest reading since February 2025. These circumstances require a tough balancing act from the BOE, which we expect will keep its policy rate unchanged at 3.75% this week while restating vigilance and willingness to act to curb inflation. We expect 2 hikes in H2.

EMERGING ECONOMIES

Not immune to global headwinds. The World Bank has revised down its growth outlook for EMDEs to 3.6% in 2026—0.4pp below its January projections. Weak growth is making the jobs challenge even more urgent in EMDEs, where 1.2 billion young people are expected to enter the workforce over the next decade. Separately, according to IIF estimates, non-resident portfolio investments in the main EMs turned negative in May (USD -26.6 bn vs. +70.6 bn in April including China, USD -45 bn vs. USD +14.7 bn excluding China). The reversal was concentrated in equities, while debt flows remained positive. Besides, EM Asia accounted for more than the total EM outflow, driven by large equity selling in Korea and India. The reversal is not a sudden stop episode; in the sharper stress episodes, debt and equity outflows tend to reinforce each other.

AFRICA & MIDDLE EAST

South Africa: Real GDP growth accelerates slightly to 0.5% q/q in Q1 2026, beating market consensus expectations (0.3%). Activity was not yet affected by the rise in fuel prices, which the government began

Find out more in our scenario and forecasts

implementing in April. Resilient GDP growth in Q1 means that the fiscal deficit for FY25/26 shrunk to 3.9% of GDP (vs. 4.5% of GDP in the prior year).

ASIA

China: Surging trade and producer prices. Exports surged in May (+19.4% y/y) supported by both volume growth and a slight uptick in export prices, while the rise in total import value (+27.5% y/y) was probably driven mostly by prices rather than volumes. China's imports from the EU slumped by 1.3% in May, widening the bilateral trade imbalance and increasing friction with the bloc. Factory gate prices rose by 3.9% y/y, the fastest in 4 years, while China's CPI held at 1.2% y/y in May, with a 16% plunge in pork prices weighing on consumer prices. The divergence between PPI and CPI signals that higher input costs are not yet passing through to consumers, squeezing corporate margins. Separately, Beijing is reportedly pursuing a $295 billion AI investment plan. The World Bank trimmed its 2026 China growth forecast to 4.2% (vs. 4.6% in our forecast), citing weaker growth in domestic demand, a decline in consumer confidence, property sector adjustment, and labor force decline.

India: Headline inflation hit a 15-month high of 3.9% y/y in May (vs. 3.5% in April), driven by rising fuel (+2%) and food prices (4.8% y/y), with further increases expected due to heatwave impacts and supply disruptions. So far, the RBI has kept its policy rates unchanged, but the likelihood of a rate hike at the next Monetary Policy Committee meeting in August has increased significantly.

Indonesia: Unexpected rate hike to support the rupiah. This move is unlikely to be sufficient, however, as investors are increasingly concerned about fiscal discipline and the decline in the quality of governance.

South Korea, Taiwan: No slowdown in booming export growth. This is due to both a positive price effect and the continued rise in export volume resulting from global AI expansion (total export value in May: +52% y/y in Taiwan, +53% in South Korea).

EMERGING EUROPE

Türkiye: Monetary status quo. The Central Bank of the Republic of Türkiye (CBRT) left its policy rate unchanged at 37.0%, in line with market expectations, while maintaining the overnight lending rate at 40.0%. The CBRT noted that the underlying trend of inflation, which had accelerated in April due to energy-related factors, moderated somewhat in May. Besides, real GDP quasi stagnation in Q1 (+0.1% qoq) and leading indicators suggest that economic activity continues to slow down, supporting the ongoing disinflation process.

LATIN AMERICA

Mexico: Headline inflation came in lower than expected in May (3.9% y/y, down from 4.5% in April), due to a significant decrease in the inflation rate of agricultural products.

Peru: As expected, the central bank kept its policy rate at 4.25% for the 9th consecutive month. CPI inflation in Lima eased to 3.9% y/y in May (from 4% in April). However, inflationary pressures persist (core inflation was 4.5% in May), and the central bank has indicated its readiness to tighten policy if necessary. Meanwhile, the presidential runoff between Keiko Fujimori and Roberto Sánchez remains too close to call. Electoral authorities now expect to announce the final results in July.

COMMODITIES

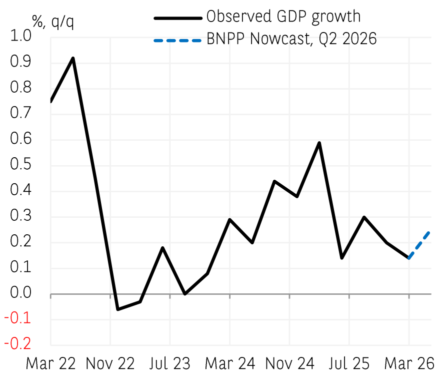
On the news that the US and Iran have reached an interim agreement, expected to be signed on Friday 19th, **Brent oil prices have reached their lowest level since the beginning of March, at 83 $/b**. This agreement should extend the ceasefire for 60 days and allow the progressive reopening of the Strait of Hormuz.

Oil demand down, solar takes off. Both OPEC+ and the US Energy Information Administration revised down their world oil demand growth forecasts for 2026. OPEC+ reduced its forecast by 0.2 mb/d for the second time since the start of the conflict to 106.13 mb/d, pointing out global uncertainty weighing on consumption. The EIA now estimates global oil demand to decline by 1.1 mb/d to 102.86 mb/d while it anticipated an increase in its previous reports. OPEC+ still expects global oil demand growth of 1 mb/d y/y for 2026. Meanwhile, solar overtook coal in US power generation in May; it is the first time the renewable source bested the fossil fuel in a calendar month. Solar and storage together made up 91% of new US capacity installed in Q1 2026.

The scenario, forecasts and nowcasts of the Economic Research – 15 June 2026

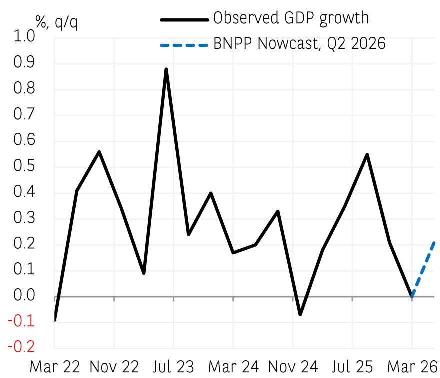
NOWCASTS OF THE ECONOMIC RESEARCH

Eurozone



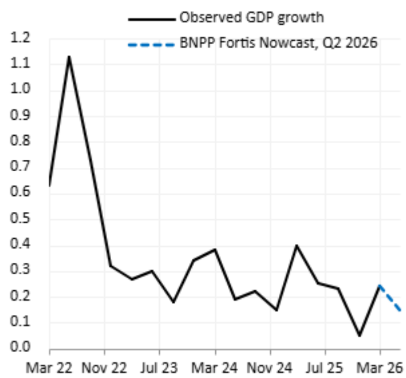
Source: Refinitiv, BNP Paribas

France



Source: Refinitiv, BNP Paribas

Belgium



Source: Refinitiv, BNP Paribas

Our nowcast for Eurozone growth has been revised downward due to the deterioration in confidence surveys (PMI, consumer confidence). It still points to a 0.2% q/q increase in activity in Q2, against a forecast of 0.3% q/q.

Our *nowcast* for French GDP growth suggests a recovery in Q2 2026, at +0.2% q/q, driven by the one-off factors that weighed on Q1 GDP (aeronautics exports and construction output).

Our *nowcast* for Q2 Belgium GDP growth suggests a slight deterioration (0.15% q/q) from Q1. The momentum in the manufacturing sector is proving more resilient than first feared. Costs are rising faster than previously expected, especially in the service sector.

UNITED STATES

The US economy is expected to grow above its potential in 2026, with an average annual growth rate of 2.3%, a yearly improvement (up from 2.1% in 2025). This apparent resilience to energy, uncertainty and tariff and energy shocks, together with above-trend productivity growth, masks K-shaped growth, driven by investment linked to AI-optimism and consumption by the wealthiest amid a wealth effect (historically high stock market valuations). Inflation overshooting is set to continue (3.7% in 2026) at least through 2028, largely because of the rise in oil prices and tariffs – although the impact of these appears to be less significant than expected. The labour market is showing clear signs of improvement that should bring the unemployment rate down toward 4.0%. Given this shift in price and employment risks amid dynamic growth, we expect the FOMC to implement one rate hike (+25pb) and bring the Fed Funds target range at 3.75% - 4.0% by year-end.

CHINA

Economic growth accelerated to +5.0% y/y in Q1 2026, vs. +4.5% in Q4 2025. It stood at 5% in 2025 as a whole and it is expected to slow moderately in 2026. Growth remains characterized by a K-shaped trajectory. On the one hand, exports are still dynamic, and Chinese goods are likely to remain competitive in the short term. On the other hand, domestic demand remains sluggish. It rebounded in the first two months of 2026 but has weakened significantly since March. The crisis in the property sector continues and confidence of households and private investors remains low. The authorities will maintain supportive fiscal and monetary policies, but their measures may continue to be modest, even in a less supportive global environment. Deflationary pressures are expected to decline in 2026, notably thanks to higher global energy prices and anti-involution measures implemented by the authorities.

EUROZONE

Eurozone growth would slow in 2026 due to spillovers from the Middle East conflict. In Q1 2026, GDP growth contracted 0.2% q/q mainly due to the volatility of Ireland's GDP data, but growth in the rest of the Eurozone remained resilient (+0.2% q/q). In 2026, consumption would be held back by falling real wages. GDP growth, which reached 1.5% in 2025, would slow down to 0.6% in 2026, before rebounding at 1.6% in 2027, while inflation would rebound to 3.0% in 2026 and 3.3% in 2027 (compared to 2.1% in 2025). Activity would nevertheless withstand the energy shock, supported by investment in defence, AI, and electrification, which should continue to boost intra-EU trade. As inflation rebounds, two 25-basis-point hikes in the ECB's policy rate would take place in 2026 – with the first hike expected in June – pushing the deposit facility rate to 2.5%. As inflation rebounds, another 25-basis-point hikes in the ECB's policy rate – following June's increase – would take place in Q3 2026 pushing the deposit facility rate to 2.5%.

FRANCE

GDP growth deteriorated to -0.1% q/q in Q1 (after 0.2% q/q in Q4) as a result of one-off factors, including low aeronautics exports (-20% q/q despite an increase of the output) and construction output (-1.5% q/q). From Q2 2026, growth should be affected by the impact of higher oil prices on inflation (2.4% in 2026, after 1% in 2025) and household purchasing power (with a likely impact on their consumption). In 2026, GDP growth should reach 0.8% in 2026 (after 0.9% in 2025), driven by public spending and private investment in AI. Higher inflation (2.2% in 2026, after 1% in 2025) would weigh on GDP growth.

UNITED KINGDOM

Economic activity is expected to slow in 2026, with growth decelerating to 1% from 1.4% in 2025; following +0.4% q/q in Q1, growth dipped to -0.1% m/m in April, bringing the average quarterly pace for the remainder of the year down to approximately +0.1%. This slowdown is set against a backdrop of renewed inflationary pressures triggered by the war in Iran: inflation is projected to reach 3.4% y/y, and to remain sticky and well above BoE's target at +3.3% in 2027. In this context, and contrary to the initially envisaged easing scenario, monetary policy would shift toward a tightening of 50 basis points in H2 2026. 10y gilt yields will remain elevated in 2026, before falling to 4.30% in 2027 on reduced net supply, a decline in political risk premia and a market starting to eye BoE rate cuts.

JAPAN

The energy shock is set to impact the strong momentum of the Japanese economy negatively. We expect annual GDP growth to stand at 0.5% in 2026, down from 1.1% in 2025. Higher inflation and production costs are expected to weigh on the economy's overall performance. On the other hand, the latter is still tempered by structural supply constraints and supported by fiscal policy and wage growth. Inflation has generally overshot the 2% y/y target since 2022 and is expected to stay there through at least 2028. Accordingly, the Bank of Japan initiated a process of "adjustment in the degree of monetary accommodation" in 2024, lifting the policy rate to 0.75% so far (previously negative). We expect the process to extend, including one hike (25pb) in Q2 2026, until a 2.0% terminal rate in end-2027. Japan is facing long-term rates pressure, illustrated by historically high 10- and 30-year yields, probably fueled by the level of public debt and the pace of monetary adjustment.

EXCHANGE RATES

In our base-case scenario (gradual normalisation of the Middle East situation with persistent price tensions), we expect the USD depreciation against the EUR to resume, albeit very gradually, amid broader diversification away from the dollar. We forecast EUR/USD to reach 1.21 by Q4 2026 and 1.25 by Q4 2027. We anticipate stabilisation of the yen and the GBP against the dollar in 2026 (USD/JPY 160 and GBP/USD 1.35 by Q4 2026) and 2027.

ECB: An adjustment, but not necessarily the start of a tightening cycle

As expected, the European Central Bank raised its key interest rates by 25 basis points, bringing the deposit facility rate to 2.25%. This decision, taken unanimously, reflects the Governing Council's conviction that the persistence of the energy shock warrants a monetary policy response. The ECB revised its inflation outlook upward more significantly than its growth forecasts downward. It also updated its alternative scenarios relative to the central scenario (one more favorable, two adverse). Christine Lagarde emphasized that today's decision was "robust" across all scenarios.

The persistence of inflation at the heart of the ECB's concerns. During the Q&A session, Christine Lagarde confirmed that the decision to raise rates was unanimous, unconditional, and that no alternative proposal was discussed during the meeting. The ECB President reiterated that future decisions will be made "meeting by meeting," based on available data and without a pre-set rate path. A new favorable scenario ("mild"), deemed unlikely, was added alongside the existing three scenarios (central, adverse, and severe). The severe scenario, in which inflation would deviate significantly and durably from the target, would call for an "appropriate and decisive" response. The communication framework has clearly evolved since the April meeting, with a stronger focus on the persistence of the inflationary shock rather than solely on the levels reached. Nevertheless, as Lagarde noted, long-term inflation expectations remain broadly well anchored around the 2% target – a reassuring signal for the ECB.

Upward revisions to inflation projections, with more persistent pressures. The ECB's new inflation projections for 2026 now sit midway between the central and adverse scenarios outlined in March. They reflect a combination of durably higher energy prices and more pronounced second-round effects, largely confined to food and industrial goods (excluding energy). The headline HICP inflation forecast has been raised to 3.0% (from 2.6%) for 2026 and to 2.3% (from 2.0%) for 2027. Core inflation is expected at 2.5% for both 2026 and 2027 (compared to 2.3% and 2.2% respectively). While our own forecasts for 2026–2027 incorporate a rise in core inflation in line with the ECB's projections, we anticipate more persistent pressures on agricultural and energy prices in 2027 (particularly gas/TTF prices). These translate into a higher total inflation forecast of 3.3% for 2027.

More limited growth revisions against a backdrop of resilience. The ECB's downward revisions to GDP growth are modest (-0.1 pp for both 2026 and 2027, to 0.8% and 1.2% respectively). The ECB expects some resilience in growth, supported notably by investment efforts in infrastructure, digital, and defence – the same pillars underpinning our recovery profile for activity in 2027 (1.6%).

Another rate hike expected, likely in September. At this stage, forward-looking price indicators (European Commission surveys and PMIs) confirm a gradual transmission of the energy shock to other sectors. However, the transmission remains less significant than what was observed in 2022 and still only marginally affects finished goods. The emergence of a price-wage spiral appears, for now, unlikely, as wage pressures should remain contained in 2026. The ECB anticipates a slowdown in compensation per employee growth to 3.2% in 2026, followed by stabilization at that level in 2027–2028, consistent with the 2% inflation target. In this context, we maintain our scenario of one additional 25 bp rate hike, most likely in September, followed by a plateau in 2027.

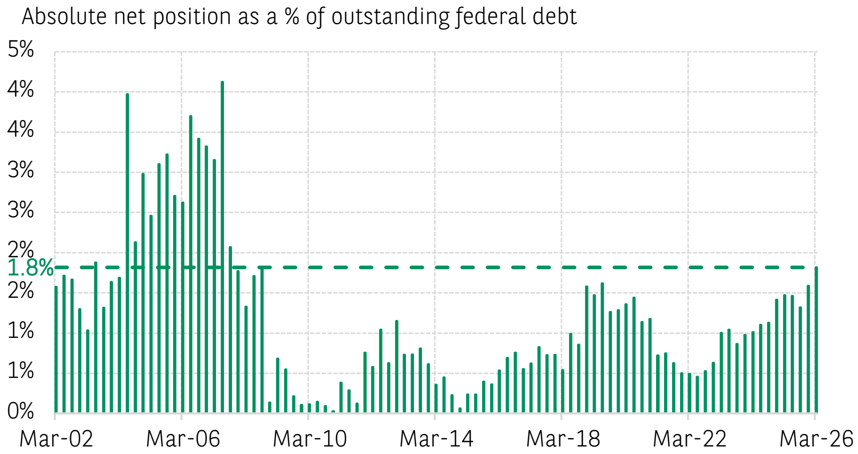
THE US REGULATORY EASING OFFERS LIMITED SUPPORT TO THE TREASURIES MARKET

Céline Choulet

Primary dealers' Treasury inventories reach their highest level since 2008



SOURCE: FEDERAL RESERVE BANK OF NEW YORK, BNP PARIBAS

A relaxation in regulations that supports Treasury market intermediation

Last year, the need to recalibrate the enhanced supplementary leverage ratio (eSLR) imposed on global systemically important banks (G-SIBs) rose to the top of American regulators' agenda[1]. The leverage constraint was on the verge of becoming more binding than risk-weighted capital requirements. It risked preventing – or even discouraging – major banks from fulfilling their role as intermediaries in the Treasury market, an undesirable situation in normal times and even more so during periods of stress. Under the new formula in effect[2], the eSLR requirements for the eight US G-SIBs now range from 3.5% to 4.25% as of 1st January[3], compared to the previous uniform 5% requirement[4].

As regulators had hoped, this easing has improved intermediation conditions in the Treasury market. Amid heightened uncertainty driven by the Iran conflict, it has enabled major banks to absorb some of the Treasuries without buyers. This is evidenced by higher net positions among primary dealers – most of which are G-SIB subsidiaries – which reached 1.8% of outstanding federal debt in March and April, the highest level since the 2008 financial crisis. In conjunction with the Federal Reserve's Reserve Management Purchases and the Treasury's buyback programmes, the easing of leverage requirements has helped to preserve liquidity in the Treasury market and contributed to lower interest rates in the repurchase agreement markets.

However the capacity to absorb federal debt is still limited

Conversely, the eSLR easing has not triggered the expected surge in demand for these securities. While G-SIBs' trading portfolios – hosting securities held by their broker-dealer subsidiaries – have expanded, their Treasury investment portfolios (held-to-maturity or available-for-sale) have remained virtually unchanged. Multiple constraints have thwarted the Secretary of the Treasury's hoped-for surge in demand, including the eSLR requirement itself. It is still binding, or near-binding, for major G-SIB depository subsidiaries. Yet, G-SIBs' Treasury investment portfolios are predominantly booked on the balance sheets of these subsidiaries. The proposed reform of G-SIB capital surcharges (still under consideration) may further support Treasury market liquidity, but it will not fully alleviate balance sheet constraints[5].

celine.choulet@bnpparibas.com

1 A leverage ratio is a non-risk-weighted capital requirement designed to ensure that a bank's size – regardless of its risk profile – does not exceed a certain multiple of its capital. See Bensaidani, A. and Choulet, C. (2025), The US Treasuries Market, An Idol with Feet of Clay – Oiling the Wheels, EcoInsight, BNP Paribas.
2 The new eSLR requirement has been aligned with the Basel recommendation, set at 3% plus a buffer equal to 50% of the G-SIB surcharge calculated under the Financial Stability Board's method.
3 The effective date of the new eSLR rule was set for 1st April 2026, but banks were permitted to adopt it early as of 1st January 2026.
4 The buffer for their depository institution subsidiaries is capped at 1%, so their eSLR requirement cannot exceed 4% (down from the previous 6% requirement).
5 See Choulet C. (2026), *A drop of oil in the Treasuries market's gears*, forthcoming in EcoInsight.

The bank for a changing world

IN LATIN AMERICA, THE ENERGY CRISIS IS EXPECTED TO HAVE A MODERATE IMPACT ON PUBLIC FINANCES

Lucas Plé

Latin America is not exposed to the risk of a disruption in hydrocarbon supplies due to the conflict in the Middle East. However, the rise in international energy prices is exerting pressure on the region's public finances. In Brazil, Mexico and Colombia, fuel subsidies are increasing the risk of fiscal slippage; however, this risk is somewhat mitigated by the projected rise in oil-related fiscal revenues. In Chile and Peru, the lack of subsidies points to a significant inflationary impact that could result in a monetary tightening. This would increase the interest burden on public debt, but the moderate fiscal deficits in these countries should enable them to absorb the shock. Furthermore, governments in the region are expected to manage any tightening of international financial conditions with relative ease.

The energy shock poses moderate risks to public finances in Latin America

	Brazil	Colombia	Mexico	Chile	Peru
Fiscal deficit 2025, % GDP	8.1	5.7	4.9	2.8	2.4
Interest payments on debt 2025, % government revenue	19.5	8.4	24.4	3.3	7.4
Government debt, % GDP	75.2	64.3	47.8	43.5	28.8
Share of debt held by non-resident investors, % total	12.0	28.8	25.7	34.2	12.4
Share of foreign-currency debt, % total	3.4	28.3	15.7	34.0	41.6

Note: Sovereigns are ranked according to their level of risk exposure, ranging from green (low exposure) to red (high exposure).

SOURCES : IMF, WORLD BANK, NATIONAL INSTITUTES OF STATISTICS, BNP PARIBAS

The impact of the energy shock on primary fiscal balances is expected to be limited, but the risks of slippage should be closely monitored

The governments of Chile and Peru have not introduced any fuel subsidies. Consequently, gasoline and diesel prices have risen by 31% and 60% respectively in Chile, and by 43% and 65% in Peru since the start of the conflict in the Middle East. The inflationary impact of rising energy prices in these countries will be significant[1], as transport accounts for 12-13% of the consumer price index.

In Brazil, the cost of the subsidies introduced since March (BRL 7.5 billion per month) is expected to be entirely offset by the rise in oil revenues (BRL +8.5 billion per month). However, given the electoral context, these subsidies could be increased. In such a scenario, the energy shock could result in a negative net cost for public finances.

In Mexico and Colombia, fuel prices are set by the government, which increases the risk of fiscal slippage. The difference between international and domestic prices is an indirect subsidy financed by the state. Since late February, gasoline and diesel prices have risen slightly in Mexico (+10.6% and +4.1% respectively) while remaining virtually unchanged in Colombia (+1.9% and +2.7% respectively). The cost of subsidies could therefore be significant and may not be fully offset by the increase in fiscal revenue from oil.

Chile and Peru have the fiscal leeway to absorb higher rates in the event of a monetary tightening.

So far, the monetary *status quo* expected prior to the energy shock has been preserved in Chile and Peru; however, given the inflationary impact of the energy shock, an increase in key interest rates is likely. Monetary tightening is expected to result in a higher interest burden on debt, yet these countries have the fiscal leeway to absorb this additional cost. Fiscal deficits were below 3% of GDP in 2025, and interest payments did not exceed 8% of fiscal revenue (*Heatmap, lines 1 and 2*).

Other central banks in the region are not expected to react to the energy shock. In Brazil and Mexico, they have cut their key interest rates since the start of the conflict, in reaction to disinflation (in Brazil) and slowing growth (in Mexico). In contrast, the Colombian central bank has raised its key interest rate in response to domestic inflationary pressures that existed prior to the conflict in the Middle East. In Colombia, the rise in debt interest payments in 2026 will further reduce fiscal space, which has already been diminished by the government's expansionary fiscal policy.

1 Year-on-year, inflation rose from 2.2% in February to 3.9% in May in Peru. In Chile, it rose from 2.4% in February to 4% in April.

The risks associated with a tightening of global financial conditions are limited in the short term

Latin American sovereigns appear vulnerable to a tightening of international financial conditions (Heatmap, lines 4 and 5), which raises risks of capital outflows and downward pressure on currencies. This vulnerability arises from the significant shares of debt denominated in foreign currency (Peru, Chile, Colombia) and debt held by foreign investors (Chile, Colombia, Mexico). Only Brazil has limited exposure to these risks.

However, certain factors help to mitigate the risks for the most vulnerable countries. In Chile and Peru, the governments can manage an increase in debt servicing costs due to their comfortable fiscal buffers. Besides, the depreciation of exchange rates against the US dollar since the start of the conflict has been modest (-3.3% in Chile and -1.7% in Peru). Colombia and Mexico, being oil-producing countries, have thus far avoided the financial volatility resulting from the energy shock – Colombia's energy trade balance shows a healthy surplus, while Mexico's shows a moderate deficit[2].

In conclusion, similar to Asia[3], the energy shock poses moderate risks to Latin America's public finances, which should remain manageable if the conflict in the Middle East is resolved soon. Despite the fact that Colombia and Mexico are oil-producing countries, the deterioration of public finances in these countries is expected to continue.
