CPB Netherlands Bureau for
Economic Policy Analysis

National Productivity Board 2024 annual report

Labour productivity in the market sector declined by 1.4% in 2023.

Exporters are the most productive firms in the Netherlands, but also their suppliers perform above average.

CPB - February 2025

Leon Bettendorf &
Michael Polder (Statistics Netherlands)

Preface

Productivity has shifted to the top of the political agenda in the last years. In view of the limitations to a further expansion of the labour supply, productivity growth is the principal way to support our future living standard. Unfortunately, the Netherlands, as all OECD countries, has been struggling with a declining trend in productivity growth during the last decades. We do not yet fully understand the causes of this global productivity slowdown.

CPB is part of a network of independent National Productivity Boards in the EU. The CPB has been a National Productivity Board since 2017. The main NPB tasks are monitoring and analysing productivity developments in the Netherlands. As in previous years, we summarise research on productivity issues in this Annual Report 2024.

We are preparing three publications this year. First, we participate in a multi-country project of the Productivity Institute (UK). The aim of this project is to identify and compare country-specific productivity trends and pro-productivity policies. Second, we will analyse the evidence on changing business dynamics in the Netherlands and the consequences for firm-level productivity and innovation. Finally, we will provide the analysis underlying our projections of long run productivity.

Pieter Hasekamp
Director CPB

Samenvatting

De arbeidsproductiviteit in de marktsector daalde in 2023 met 1,4%. Sinds 2000 is de productiviteit alleen in 2009 nog sterker gedaald. De uitfasering van de gaswinning sinds 2014 heeft de jaarlijkse productiviteits-groei met gemiddeld 0,3%-punt gedrukt.

We begrijpen nog niet helemaal waarom de productiviteitsgroei is afgenomen. Zoals in alle OESO-landen heeft Nederland last van een vertraging van de productiviteitsgroei. In een literatuuronderzoek vinden we verschillende verklaringen, maar de bijdrage van elke oorzaak is moeilijk te bepalen vanwege de sterke verbanden tussen de oorzaken.

Het productiviteitsverschil tussen de 10% meest productieve bedrijven en minder productieve bedrijven nam in 2021 toe. We stelden in ons vorige rapport (CPB, 2024) vast dat de productiviteitskloof tussen de bedrijven van de top 10% en de bedrijven van de onderste 10% sterk is toegenomen in 2020. Uit een update van deze analyse blijkt dat de kloof in 2021 groot bleef en niet te wijten was aan de bijzondere omstandigheden in 2020. Productiviteitsgroei in de economie kan voortkomen uit productiviteitsgroei binnen bestaande bedrijven of door activiteiten te verschuiven naar productievere bedrijven. De bijdrage van de verschuiving daalde in de verwerkende industrie en de dienstensector in de periode 2011-2019. De bijdrage van de bedrijvendynamiek bleef stabiel in de handel, terwijl deze belangrijker werd voor overige industrieën (bouw, energie, water en afval).

Exporteurs en hun directe toeleveranciers vormen de meest productieve groep bedrijven in Nederland. Uit de literatuur weten we dat exporterende bedrijven productiever zijn dan niet-exporterende bedrijven. We laten met nieuwe netwerkdata een duidelijk patroon zien: exporteurs zijn groter en productiever dan hun toeleveranciers, die op hun beurt beter presteren dan hun eigen toeleveranciers. De productiviteit van exporteurs en hun toeleveranciers wordt versterkt via drie mechanismen: leereffecten, selectie en schaalvoordelen. Beleid dat bedrijfsnetwerken versterkt, kan bijdragen aan productiviteitsgroei.

Summary

Labour productivity in the market sector declined by 1.4% in 2023. Since 2000, only 2009 saw a stronger fall in productivity.. Phasing out gas extraction since 2014 depressed annual productivity growth by 0.3%-point on average.

We do not fully understand why the productivity growth has decreased. As in all OECD countries, the Netherlands is suffering from a slowdown in productivity growth. A survey of the literature provides various explanations, but the contribution of each cause is difficult to determine due to the strong links between the causes.

The productivity difference between frontier firms and non-frontier firms was growing in 2021. We observed that the productivity gap between the top-10% firms and the bottom-10% firms strongly increased in 2020. An update of this analysis shows that the gap remained large in 2021. Productivity growth can originate from growth within existing firms or by reallocating activities to more productive firms. The contribution of reallocation declined in manufacturing and services during the period 2011-2019. The contribution of business dynamics remained stable in trade while it became more important for other industries (construction, energy, wate and waste).

Exporters and their direct suppliers form the most productive group of firms in the Netherlands. From previous research we know that exporting firms are more productive than non-exporting firms. From new network data, a clear pattern emerges: exporters are larger and more productive than their suppliers, who, in turn, outperform their own suppliers. Productivity of exporters and their suppliers benefit through three main channels: learning effects, selection and economies of scale. Policies that strengthen firm networks can contribute to fostering productivity growth.

1 Introduction

This Annual Report summarises research on productivity developments in the Netherlands.[1] It consists of four parts.

In the next section we summarize the unfavourable productivity developments in 2023. We show that phasing out gas extraction since 2014 contributed to the low productivity growth rates in the Netherlands compared to other European countries.

Various explanations are found in the literature why productivity growth is slowing down. No consensus is yet reached on the contribution of each explanation of the slowdown. We discuss the main studies in the third section.

The fourth section, provided by Michael Polder (Statistics Netherlands), updates and extends the evidence on firm-level productivity. He documents productivity differences between firms and shows that the contribution of continuing firms, new firms and closing firms to productivity growth differ across industries, as well as between time periods.

The last section exploits new data on the Dutch production networks.[2] It is well known that exporting firms are more productive than an average firm. This section discusses the impact on productivity of firms that are suppliers to exporting firms.

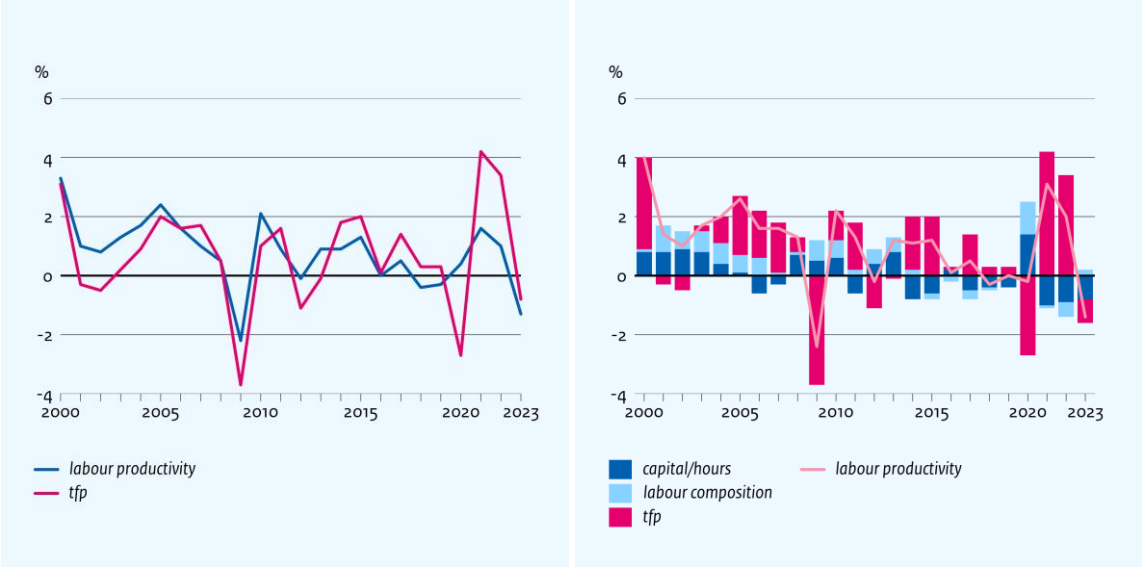
[2] This is a translation of Freeman et al. (2024).

2 Recent productivity developments

Labour productivity in the market sector in 2023 was 1.4% lower than in 2022. Labour productivity is defined as value added per hour worked.[3] Figure 2.1a shows that productivity only declined more (with -2.2%) during the great recession in 2009 (CBS, 2024). The decomposition in figure 2.1b shows that the negative labour productivity growth in 2023 was driven by negative contributions of TFP growth (-0.8%) and capital deepening (-0.8%).[4] The number of working hours has increased, while the capital stock reduced (due to non-ICT capital). The long term decline in capital stock per hour since the mid 2010-s seems to continue at an even faster pace. TFP growth (a measure of the efficiency with which labour and capital are used in the economy) turned negative in 2023. TFP grew fast in 2021 and 2022, in part through recovery from the corona pandemic shock in 2020

Figure 2.1 Labour productivity in de market sector declined in 2023



Source: CBS (2024); 2022 & 2023 are preliminary.

Phasing out gas extraction depressed productivity growth, starting in 2014. The mining and quarrying industry is very capital intensive, resulting in a high labour productivity. Labour productivity in this industry grew on average with 0.7% before 2014, while it fell with almost 16% per year after 2014 due to the phasing out of gas extraction (De Vries et al., 2024). Figure 2.2 shows that the average labour productivity growth in the Netherlands was one of the lowest in Europe. However, whereas the average contribution of the mining industry was negligible in most of the countries, it was negative (-0.3%-point) in the Netherlands (and +0.2% in the US). The productivity growth of the market sector excluding mining in the Netherlands was much closer to the average value in Europe. Next to mining, other industries that contributed negatively to productivity growth in 2023 are transport and storage (-0.5%-point) and manufacturing (-0.4%-point).

[3] The market sector includes all sectors, with the exception of the government, education, households and rental & trading of real estate.

[4] We use the identity: $\tilde{Y}_t - \tilde{H}_t = \alpha_t(\tilde{K}_t - \tilde{H}_t) + (1-\alpha_t)\tilde{C}_t + \tilde{A}_t$, where $\tilde{Y}$ is value added growth, $\tilde{H}$ is growth in hours worked, $\tilde{K}$ is capital growth, $\tilde{C}$ is labour composition growth, $\tilde{A}$ is TFP growth and α is the share of capital costs.

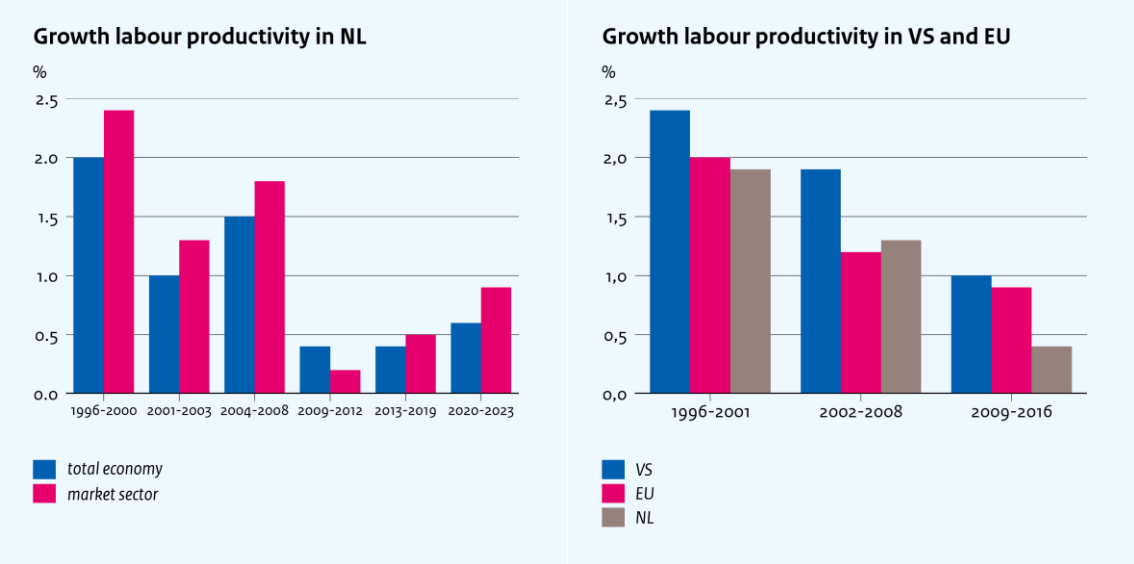
3 Explaining the productivity slowdown: a survey

We do not sufficiently understand current productivity developments, which makes insight into future developments uncertain. As in many other countries, the Netherlands is suffering from a slowdown in productivity growth. In the literature, various explanations are put forward as to why growth has decreased, but the contribution of each cause is difficult to determine due to the strong links between the causes. In addition, it is uncertain whether the outlined trend developments are permanent or temporary. For example, will artificial intelligence really develop into a general purpose technology that will put an end to the weak productivity growth? And, if so, how long will that last?

All OECD countries are experiencing slowdowns in productivity growth. Figure 3.1a shows the annual growth of labour productivity in the Netherlands in the total economy and in the market sector (this is excluding the government). GDP per hour worked grew on average around 2 percent around the turn of the century. This growth has fallen back to below 1 percent after 2009. Figure 3.1b shows the slowdown in other countries. The decline in GDP growth per hour worked started in all countries before the Great Recession (2008-2012). The Great Recession may therefore have exacerbated the slowdown but cannot be the cause (Fernald et al., 2023).

The global slowdown in productivity growth suggests common causes but there is no consensus yet on which cause is the most important and not even on whether the slowdown will be temporary or long-term. This slowdown puzzle contributes to the great uncertainty of projections in the near and distant future. We discuss the most important, global causes one by one, although they are strongly related. [5]

Figure 3.1 Labour productivity growth is falling (value added per hour worked)



Source: De Vries et al. (2024), figure 3.1.; De Bondt et al. (2021), figure 3.1.1.

[5] See the surveys of Moss et al. (2020), Akcigit et al. (2021) and Goldin et al. (2024). For a discussion of specific Dutch causes, such as the large share of self-employed people and low R&D investments, we refer to Roelandt et al. (2019) and de Bondt et al. (2021).

3.1 The diminishing potential of innovative ideas

Technology pessimists are skeptical about innovations that can still significantly increase productivity. Gordon (2016) argues that the number and breadth of innovations was exceptional in the period 1870-1970 and that we have now returned to the normal, structural level. Bloom et al. (2020) argue that the productivity of researchers has fallen sharply because it is becoming increasingly difficult to find new ideas. They express the TFP growth as the product of the number of researchers and their productivity. They observe a strong increase in the effective number of researchers, but the problem is that productivity in research has fallen just as sharply. The best illustration is provided by Moore's Law. The number of transistors in an integrated circuit has doubled every two years, but this required an increasing input of resources.

Jones (2022) lists three reasons why growth in GDP per capita will slow down in the future. Jones analyses economic growth in the US with a model in which TFP growth is determined by a Research & Development (R&D) sector. The first reason for a slowdown in growth is that the three main determinants after 1953, apart from population growth, can hardly grow any further. The contribution of population growth to growth in the past is 20%, while 80% stems from a rising level of education, an improved allocation of production factors and a growing size of the R&D sector (as % of population). The problem is that the last three factors are naturally limited. The second reason is that a slowdown in employment growth in R&D is already observed. The third reason is that natural population growth (excl. migration) is already negative in many developed countries. In the long run, economic growth remains proportional to population growth.

Technology optimists, on the other hand, emphasise the future potential of innovation in ICT; see for example Brynjolfsson and McAfee (2014). As with previous industrial revolutions, they expect that it will take time before the combination and diffusion of multiple new technologies will lead to a revival of productivity growth. Artificial Intelligence (AI) could become a new general purpose technology. AI is expected to have major effects on the economy, and on productivity in particular, because AI not only increases the productivity of the production of products but also the production of innovative ideas (R&D). Initial studies estimate that AI increases macroeconomic productivity by 1%-point per year for 10 years (see the discussion in Aldasoro et al., 2024). However, Acemoglu (2024) is skeptical about the extrapolation of early, simple applications and calculates that TFP growth increases by less than 0.1%-points per year. In addition to the potential of AI, Jones (2022) believes that growth can accelerate in the future because there is still sufficient room for expansion of the R&D sector at the global level.

Philippon (2022) disputes the existence of a structural break in technological progress. He criticizes the standard specification of the TFP growth rate. The literature assumes a constant TFP growth rate (i.e. exponential growth), while Philippon argues that the evidence is more in line with a constant absolute growth rate (additive growth). If absolute growth remains constant, the TFP growth rate will decline in the future. In the US, he finds a structural break in TFP growth around 1930 in the period 1890-2019. Due to catch-up growth, TFP growth in the eurozone and Japan was higher than in the US until 1990. After 1990, absolute growth declined sharply and became smaller than in the US. Assuming additive growth, Philippon finds no evidence of a recent slowdown in technological progress.

3.2 Divergence between high- and low-productivity firms

The OECD found that the difference in productivity between high-productivity firms and low-productivity firms has increased (Berlingieri et al. 2017a). Because knowledge about new production techniques and organizational forms is spread less quickly, low-productivity firms are less able to keep up with the

productivity growth of high-productivity firms. The deterioration in knowledge diffusion might be related to the increasing importance of intangible capital (see section 3.6). The divergent productivity development may explain the slowdown in productivity growth.

In the Netherlands, the productivity difference between the most productive and median firms started to increase around 2015. De Bondt et al. (2021, Table 5.3.2) find that the difference in both labour productivity and TFP increased before 2005 during the period 2000-2015. The divergence in productivity was stronger in industry than in the service sector. Research in van Heuvelen et al. (2018) confirms that the productivity gap between the top 10% firms and the median firms has remained stable in the period 2006-2015. In the next section we show with a new dataset that the top-median gap increased by 0.7% annually from 2015 to 2019. The divergence hypothesis is not a good explanation since the slowdown in productivity growth started much earlier in the Netherlands.

3.3 Increase in market concentration

According to this hypothesis, lower productivity growth is associated with the trend towards less competitive markets. Firms with more market power have fewer incentives to increase their productivity. The emergence of less competitive markets is related to the superstars hypothesis (or winner-takes-all).[6] After superstars have acquired a dominant market position, they shift their activities from innovative investments to strategies to protect their excess profits. De Ridder (2024) argues that the increase in intangible capital explains these developments. Since intangible capital is characterized by a combination of low marginal costs and high fixed costs, this promotes the growth of large firms and a reduction in productivity growth. The increase in market power seems to be a problem mainly in the US.[7] De Loecker et al. (2020) estimate the markup of firms (defined as the ratio of price and marginal costs) as a measure of market power. They find that the average markup in the US nearly tripled from 1980 to 2016.

However, an increase in market concentration can also promote productivity growth. When more productive firms gain market share at the expense of less productive firms, the reallocation contributes to aggregate productivity growth.[8] In Europe, the increase in market concentration does not seem to be associated with more abuse of market power. Bighelli et al. (2023) estimate stable markups in 15 European countries. Van Heuvelen et al. (2021) do not find that markups in the Netherlands increased significantly in the period 2006-2016. The slowdown in productivity growth in the Netherlands therefore does not seem to be explained by the increase in the market power of firms.

3.4 Weakening of business dynamism

Productivity growth has been affected by reduced business dynamism. With healthy business dynamism, old, low-productivity firms are replaced by more productive new firms (principle of creative destruction). Released inputs are put to more productive use, which contributes to a stimulation of productivity growth. Decker et al. (2017) point to the relationship between reduced business dynamism and slowed productivity growth in the US. Freeman et al. (2021) show that business dynamism in the Netherlands is slowing down (after 2006), mainly as a result of a declining share of start-ups. They find that the reduced dynamism has

[6] See e.g. Autor et al. (2020).
[7] See e.g. Eeckhout (2022). This hypothesis is contested by Shapiro et al. (2024).
[8] See the discussion of the distinction between good and bad concentration in Covarrubias et al. (2019).

contributed to lower TFP growth (by 0.2%-points per year), especially in the service sector. The weakening of business dynamism may be a cause, but not the main cause of the slowdown in productivity growth.

3.5 Shifts in sector structure

The shift towards the service sector reduces average productivity growth. The share of the service sector (incl. healthcare) in the economy increases, while the productivity of the service sector grows less than that of industry. De Bondt et al. (2021, section 5.2) confirm that the shift towards the healthcare and service sectors has had a negative effect on productivity growth in the period 1996-2016, but that this shift is not large enough to really explain the slowdown in productivity growth (see an update in De Vries et al., 2024). Most of the productivity growth is found within the industries, while the negative reallocation effect between sectors remains small. Duernecker et al. (2023) compare the strong growth in labour productivity in the period 1970-1985 with the slow growth in 2002-2017 for several high-income countries. They also show that the decline in productivity growth in the Netherlands (2.7%-points) is only partly due to the changed sector structure (0.5%-points).

3.6 Measurement problems

The literature also suggests that the growth slowdown is not a real phenomenon but is a consequence of larger measurement problems of the new economy. Measuring productivity faces classic problems, e.g. the correction for quality improvements in the healthcare sector. But the problems have been exacerbated by the digitalization of the economy.[9] For example, before we could take digital photos, the productivity of developing and printing photos could be calculated. Nowadays, we store and view photos on our phones. How should the productivity of this 'free' service be calculated? However, calculations by Syverson (2021) indicate that measurement problems are probably insufficient to explain the productivity slowdown.

Measurement problems are specifically mentioned in the valuation of the increasing intangible capital stock. Intangibles consist of, for example, R&D, software, human and organizational capital. According to Brynjolfsson et al. (2021), errors in measuring productivity effects of investments in intangibles can be described with a J-curve. At the beginning of the project, productivity is underestimated because inputs are also used for the production of intangibles that are poorly measured. In the course of the project, productivity is overestimated because intangibles are also used for the production of measured tangibles. In the Netherlands, too, intangible investments now exceed tangible investments, making it more difficult to estimate TFP growth.

3.7 Concluding remarks

We conclude that the literature is still very uncertain about the true causes of the slowdown in productivity growth and about the development of trends in the future. It is still unclear what the contribution of each cause is to explaining the slowdown (see the approach in Goldin et al., 2024). And what is the role of links between the causes? The growing importance of intangibles seems to be related to the increasing market power of superstars and the reduced business dynamics. A second question is how permanent are the outlined trend developments? Will the technology pessimists or the optimists be right about the breakthrough of new, substantial innovations? Is the weakening of business dynamics a temporary

[9] See the recent overview by Martin et al. (2024) and also De Bondt et al. (2021, section 6).

or a long-term phenomenon? Given these uncertainties, CPB, as the NPB, will continue to study the low productivity growth.

4 Productivity differences across Dutch firms are large and persistent

Michael Polder (Statistics Netherlands)

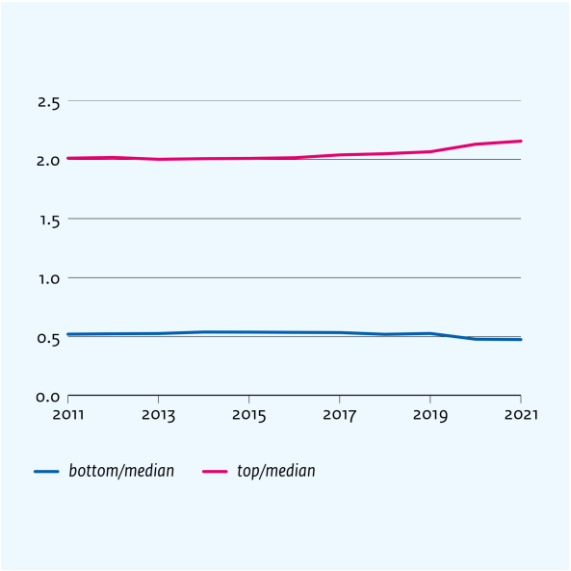
We present an update and extension of evidence on the dynamics of firm-level heterogeneity in labour productivity, and the relation between business dynamics and aggregate (industry-level) productivity. Understanding more about heterogeneity and the role of dynamics is essential for understanding aggregate growth. In particular, statistics about the within-industry dispersion in productivity are informative about whether the performance of firms in a particular industry is similar, or whether there are "winners" and "losers". A stylized fact in the literature is that the latter is the case (e.g. Syverson, 2011): the degree of heterogeneity in productivity is persuasive, even within narrowly defined industries . This is indicative for firm-level differences in things such as production technologies and innovation, as well as market frictions (Bartelsman and Wolf, 2018). In addition, productivity differences are found to be closely linked to differences in renumeration of workers (Cunningham et al. 2023). Finally, macroeconomic growth depends in part on creative destruction, through which the least productive firms are driven out of the market, making way for new innovative and more productive firms, as well as reallocation of market shares towards more productive incumbent firms (Aghion et al. 2021).

Note on data used
We use an experimental dataset on firm-level productivity that is currently being developed at Statistics Netherlands. This dataset is an updated and improved version of that used in the previous edition of the National Productivity Monitor (CPB, 2024). The outcomes presented should be regarded as experimental. In addition, due to differences in delineation of the research population, methodological choices (e.g. outlier exclusion), and variable definitions, these figures may not fully align with official statistics. The dataset currently covers the period 2011-2021 and concerns incorporated enterprises only (legal forms "bv" and "nv") in the business economy (excluding the financial and real estate sectors as well as petroleum). In the indicators we only consider firms with 3 persons (full-time) employed or more.

A decade of productivity dispersion

Frontier firms in the Netherlands are about twice as productive as the median firm, whereas the bottom group is about half as productive as the median. Productivity is measured as value added per hour worked. Dispersion is measured by differences between percentiles of the productivity distribution. In particular, we express in figure 4.1 the labour productivity level of the top decile and the bottom decile relative to the median level. It shows large differences between firms at the top and the bottom of the distribution.

Figure 4.1 Labour productivity, frontier (top-10%) and laggard (bottom-10%) firms compared to median, business economy, 2011-2021



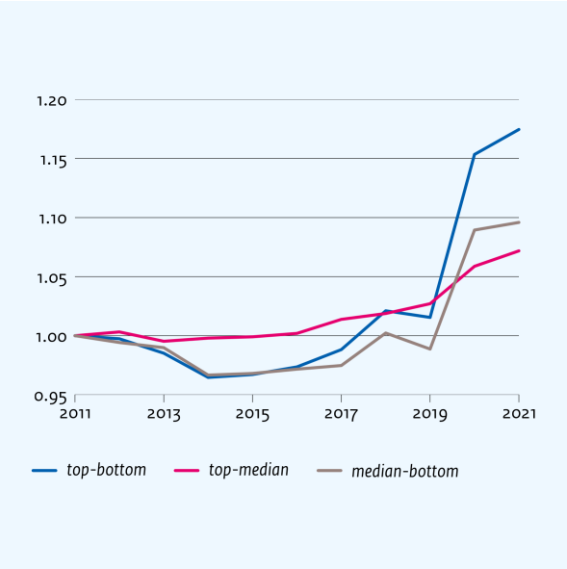
Note: top, median and bottom refer to respectively 90th percentile, median, and 10th percentile of the productivity distribution. Productivity is measured as real value added over persons employed in full-time equivalents. Percentile deviations are calculated within-industry (NACE Rev. 2, two digit) and year. Only enterprises with 3 or more persons employed and legal personality (corporations) have been included, that are part of the Business Economy (NACE Rev. 2 B-N, excl. K, incl. 95; we also exclude 19 and L). Nominal value added is deflated using National Accounts industry-level deflators. For more on the underlying data, see CBS (2022a, Chapter 2).

Growing dispersion in the Netherlands can already be detected before the Covid period. Figure 4.2 shows the change in dispersion relative to the base year 2011. While the figure confirms the stable pattern found in van Heuvelen et al. (2018) for up to 2014/2015, an increase in dispersion can be detected for more recent years. This trend started already before Covid. From 2015 to 2019, the top-bottom gap increased by on average 1.2% annually, composed of a 0.7% increase of the top-median gap and a 0.5% between median and bottom. Growing dispersion has been documented globally (Andrew et al., 2016), but there is variation across countries (Berlingieri et al., 2017) and over time (e.g. in the case of US manufacturing, Cunningham et al., 2023).

The dispersion increased strongly in 2020 and more gradually in 2021. When the economy was hit by the Covid-shock for the first time, this resulted in a substantial decrease in macroeconomic productivity (see figure 2.1).[10] Nevertheless, figure 4.2 shows that this impact has been uneven across the business population, resulting in a productivity spread much higher than in previous years and notably a higher gap for the lowest part of the distribution. Moving further into the Covid period, the dispersion continued to increase. The top-bottom gap grew in 2021 with 1.8%, mainly due to the frontier firms moving away from the median (1.2%).

[10] We note that employment is in full-time equivalents and refers to hours worked according to contract.

Figure 4.2 Labour productivity dispersion, business economy, 2011-2021 (2011 = 1)



Note: Ratios are expressed relative to the value in 2011.

Multinational firms are strongly represented in the frontier group. While the lion share of firms in the frontier group are independent small and medium enterprises (SMEs), their share is substantially lower than in the overall firm population (74.5% of frontier firms versus 83.6% in the population in 2021; table 4.1). Especially foreign multinational enterprises (MNEs) form a relatively large part of the frontier, compared to their population share (16.1% versus 9.3%). The post-2015 increase in dispersion has gone hand in hand with a slight shift within the frontier group, away from Dutch multinationals towards the other groups of firms.

Table 4.1 Composition of the frontier group.

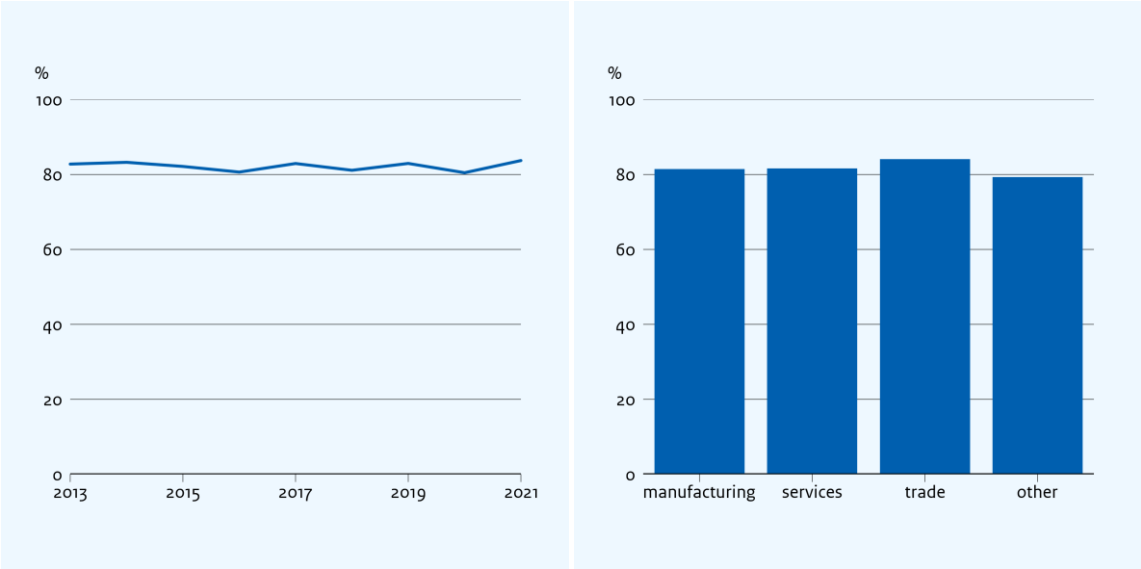
	independent SME	domestic large	Dutch MNE	Foreign MNE
Population				
2015	83.8%	0.5%	7.5%	8.2%
2019	83.6%	0.7%	7.0%	8.8%
2021	83.6%	0.7%	6.4%	9.3%
Frontier				
2015	73.1%	0.4%	10.8%	15.7%
2019	73.5%	0.5%	9.7%	16.3%
2021	74.5%	0.6%	8.7%	16.1%

Note: independent SME not part of a domestic group with 250 persons employed or more, nor part of a multinational; domestic large is a firm with more 250 persons employed or more and not a multinational; Dutch MNE is an enterprise under Dutch ownership (head office and/or affiliates); foreign MNE is an affiliate of a foreign multinational.

We find that persistence at the frontier is substantial. The composition of the frontier group changes each year. The results in figure 4.3 suggest that persistence is rather high with over 80% of firms remaining at the frontier from year to year, or reappearing after a single year.[11] This rate has been rather stable over time and across sectors.

[11] These numbers are lower than in the previous edition due to improvements in the data. It should be noted that we now also include firms reappearing at the frontier after one year as part of persistence. However, also without these additional cases the rates remain

Figure 4.3 Persistence at the productivity frontier (fraction of firms that stays in top decile)



Note: For these calculations, labour productivity was smoothed by taking the average over two consecutive years. When firms return to the frontier after a single year, this has also been counted as persistence. Figure by sector concerns averages across the period 2013-2021. NACE codes manufacturing: 10-33, ex. 19; services: 49-82 + 95, ex. K and L; trade: 45-47; other: 35-43.

Industry productivity growth: the contribution of business dynamics

The productivity growth of industries is composed of the contribution of continuing firms, new firms and closing firms. Figure 4.4 shows a decomposition of sectoral labour productivity growth for the period 2011 to 2021. The contribution of continuing firms is broken down further into a within component (i.e., the contribution of productivity growth within those firms), and a between component (i.e., the gain in aggregate productivity due to changes in the relative size of firms). The contributions of entry and exit are broken down further into those pertaining to actual firm birth or deaths, and those that are due to other reasons (such as M&A, restructuring and split-offs).

There are sectoral differences in the contribution of business dynamics. In manufacturing and in industries grouped under "other" (Construction; Energy; Water; Waste), productivity growth was mainly driven by within-firm productivity growth. In trade, there is an important role for exit of below-average productivity firms. In services, there is a relatively large contribution of newly founded firms achieving above-average productivity levels.[12]

We observe that the role of business dynamics for productivity growth declined in manufacturing and services. We define the contribution of business dynamics as the combined (net) contribution of the entry, exit and between components. Comparing the periods 2011-2015 to 2015-2019 in figure 4.4, we find a decline in the importance of business dynamics in manufacturing (from 3.2 to 1.7 %-point) and services (from 2.4 to 1.0%-point). This corroborates evidence for the US on declining dynamism discussed by Akcigit and Ates (2021) and Decker et al. (2017). However, we note that in services the lower contribution of business dynamics results

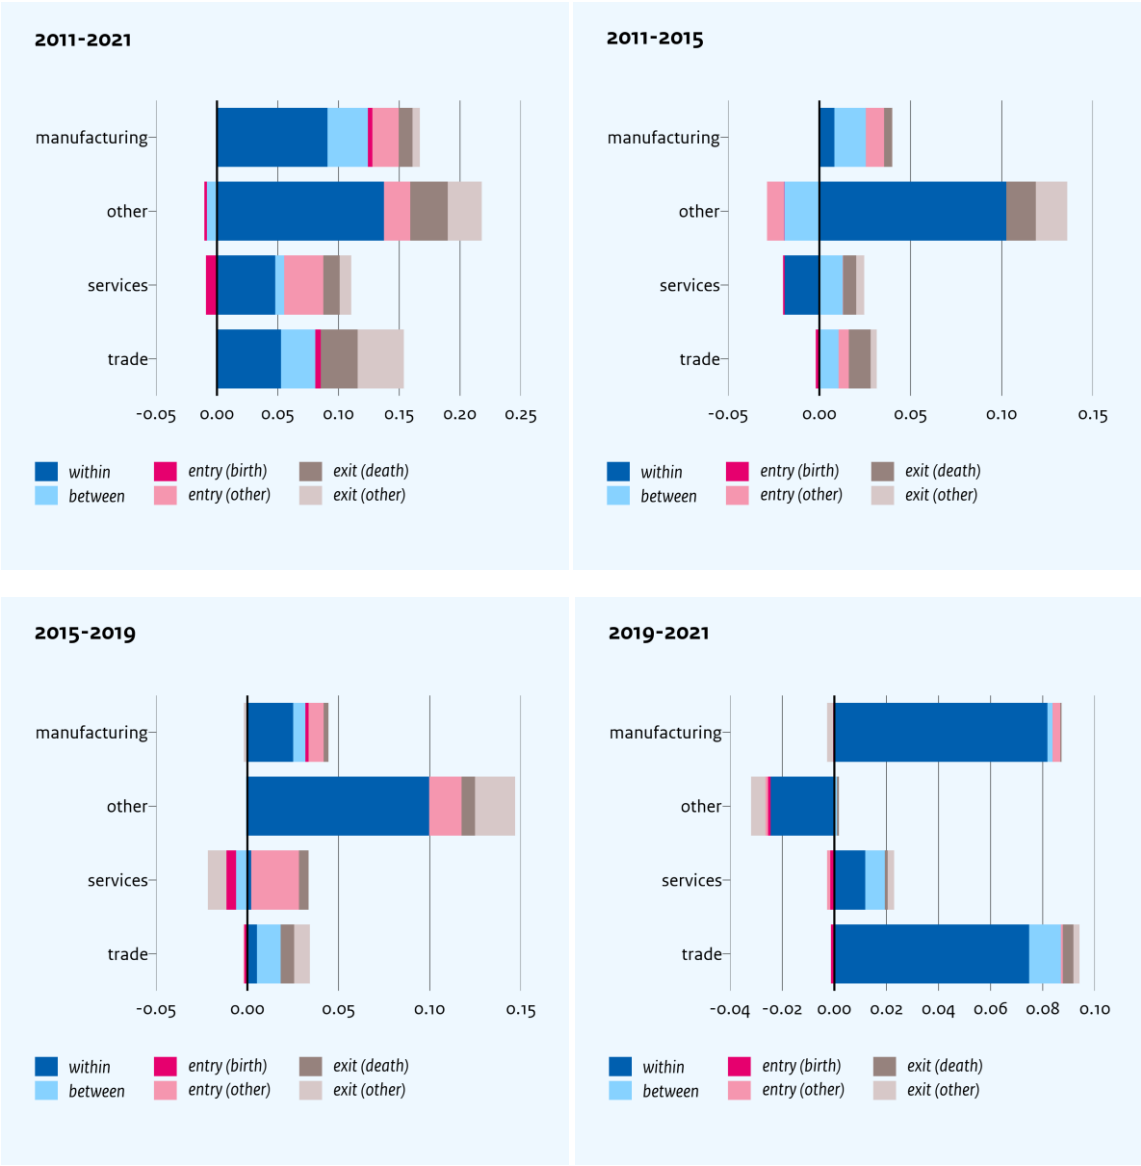
around 80%. With respect to the difference with results in Van Heuvelen et al. (2018) more research is needed. A candidate explanation is that unlike the earlier research, smaller firms (with 2 persons employed and less) have now been excluded. This is a particularly large and highly dynamic group, both in terms of business dynamics and productivity, which dominates the frontier group, and is likely to dominate the degree of dynamics observed as well. Moreover, we have improved the method to follow firms over time.

[12] Of course, considering a period of several years, there is more entry and exit than when looking at annual changes. Therefore, we find that the contributions of entry and exit are relatively large, compared to decompositions of annual changes or to contributions averaged across years.

from a mix of contributions, which does not necessarily indicate less dynamics. In the "other" industries, on the other hand, business dynamics became more important, while in trade it did not change much.

During the Covid crisis business dynamics contributed very little to productivity growth. Nearly all of the productivity growth in the period 2019-2021 was realized through within-firm changes in all sectors. Only in the group of "other" industries this resulted in a productivity decline. The contribution of exit is low. This finding is consistent with existing evidence on low productivity firms having had a higher likelihood of support during the Covid crisis (see e.g. Bettendorf et al., 2021).

Figure 4.4 Decomposition of labour productivity growth by sector



Note: Productivity is measured as real value added over persons employed in full-time equivalents. Percentile deviations are calculated within-industry (NACE Rev. 2, two digit) and year. Only firms with 3 or more persons employed and legal personality have been included, that are part of the Business Economy (NACE Rev. 2 B-N, excl. K, incl. 95; we also exclude 19 and L). Nominal value added is deflated using National Accounts industry-level deflators For more on the underlying data, see CBS (2022a; Chapter 2). Firms in the top and bottom percentile in either the productivity level or growth distributions have been excluded. The decomposition follows the method suggested by Foster et al. (2001).

5 Productivity benefits of export networks

Daan Freeman, Mark van der Plaat and Benjamin Wache (CPB)

5.1 Introduction

International trade remains crucial for the Netherlands. While concepts like strategic autonomy and reshoring have become an integral part of the debate on international trade, the export sector continues to play a vital role in the Dutch economy. Exporting firms are larger and more productive than the average Dutch firm and offer higher wages (CBS, 2022a). According to Statistics Netherlands (CBS), over 30% of gdp is generated through exports (CBS, 2022b). This added value stems not only from the exporting firms themselves but also from their suppliers. Approximately half of the jobs linked to exports are found within these supplier firms (CBS, 2022b). So, we know from previous research that exporting firms are more productive than non-exporting firms. This study extends the analysis to the whole export network.

We examine the productivity of exporters and the firms connected to them through supply networks. By focusing on firms connected to exporters, we gain insights into the broader impact of exports on the Dutch economy. Even firms indirectly involved in international trade may benefit through their connections with exporters. We emphasize productivity because it is a key driver of economic growth and competitiveness for firms and the Netherlands as a whole.

We use a new dataset from CBS that maps the Dutch production network, detailing domestic trade relationships between firms. The highly granular nature of this data allows us to uncover patterns at the firm level, rather than the traditional industry level. This enables us to identify which firms act as suppliers or customers of exporters and which do not. Suppliers to exporters, like exporters themselves, tend to be larger, more productive, and have more customers than firms not directly linked to exporters. This suggests benefits that extend beyond the (additional) revenue from supplying to exporters.

The structure of this section is as follows. Section 3.2 outlines the data sources underpinning our findings. Section 3.3 presents descriptive statistics, followed by results from several regression analyses. Section 3.4 places the findings in an international context and discusses potential explanations. The final section concludes with a summary and briefly highlights areas for future research.

5.2 Data

To map the connections between firms, we use a new dataset from CBS, the *Production Network of Businesses* (PNB). This dataset includes intermediate deliveries of goods and services between firms in the Netherlands, showing which firms trade with each other and the types of products exchanged. Firms combine various goods and services in their production processes, meaning suppliers can come from different industries. For instance, a machinery manufacturer might integrate metal components and construction advice from suppliers across different industries to develop and produce machinery. We focus on the flow of deliveries between firms in this network. This dataset is experimental. While a significant portion of this data

is based on direct observations of transactions between firms, a part is estimated using methods capable of reconstructing networks (Mungo et al., 2024). For a detailed explanation, see Buiten et al. (2021).

The PNB provides an unprecedentedly detailed view of Dutch value chains. Value chains are chains of production stages from raw materials to finished products. In existing literature, both national and international, chains are typically analysed at the industry level, describing for example the amount of agricultural inputs used in the food manufacturing industry (Buiten et al., 2023). CPB has extensively used such data in its research (e.g., van der Wal et al., 2024; Wache et al., 2024). The PNB takes this a step further by focusing on deliveries between individual firms, enabling the identification of differences within industries. This granular approach also allows for the study of dynamics such as spillover effects at the firm level.

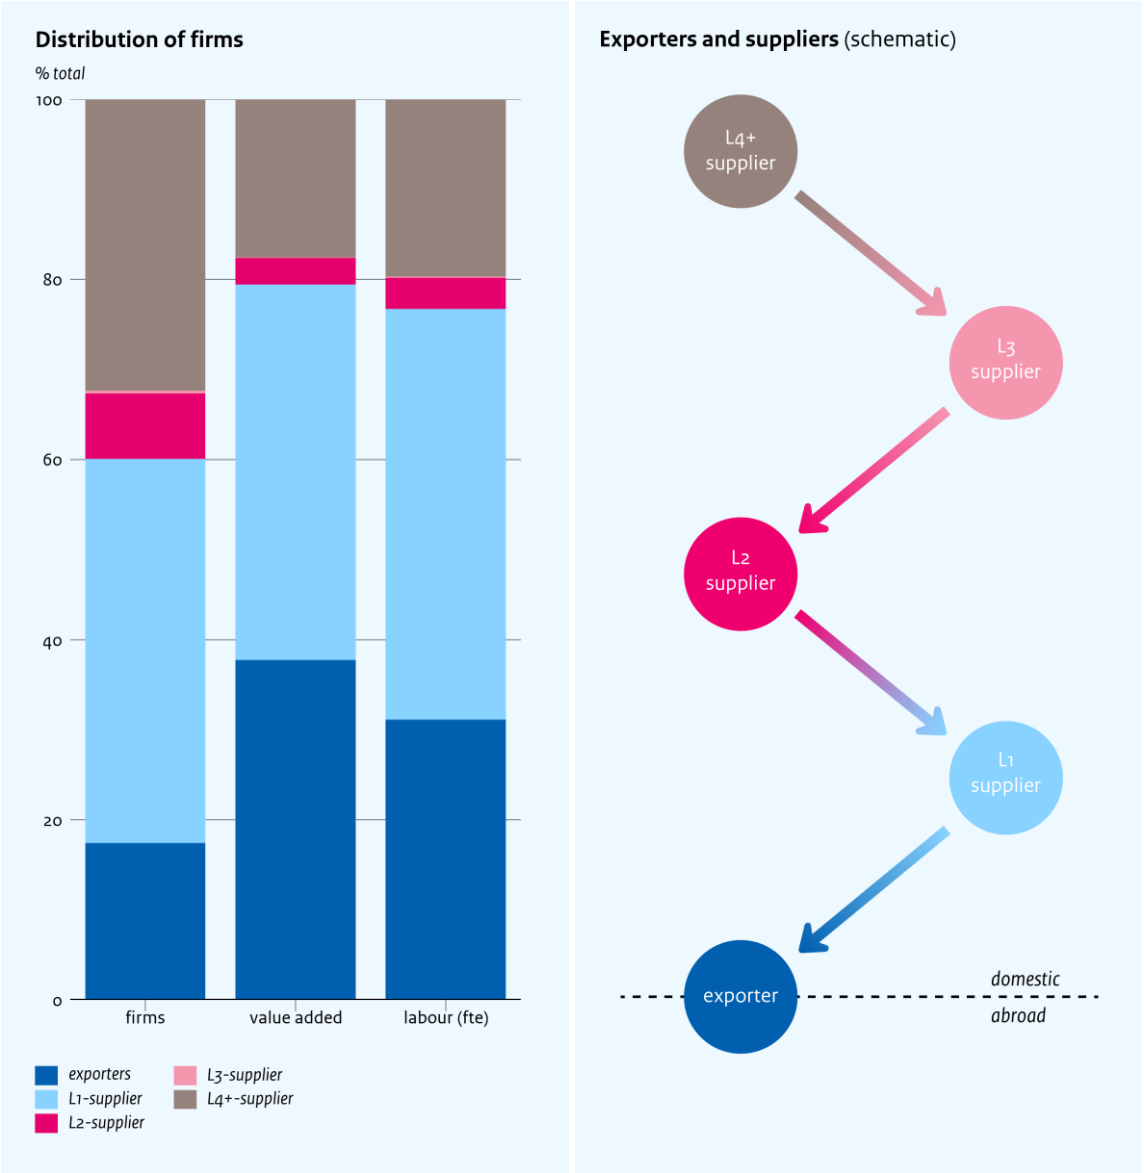
In addition to the network data, we use CBS data on firm-level productivity and international trade in goods. The productivity data includes labour productivity, total factor productivity (TFP), labour, capital, revenue, and value added. The dataset consists of data on corporations, thus excluding self-employed individuals and other non-corporate entities. Based on trade data, we identify exporting firms as explained below.[13] Our analysis is limited to goods exports, as data on international trade in services is unavailable.

The combined dataset includes around 55,000 firms for the analysis year 2018. A firm is classified as an exporter if it was actively exporting goods for at least three years between 2015 and 2018, to exclude one-time exporters.[14] Exporters in the trade and transport industries are excluded, as these often act as intermediaries. Additionally, firms with fewer than five employees are excluded. These criteria result in a higher proportion of exporters (17%) in the dataset compared to the overall firm population (10%) (CBS, 2022b).

Importantly, we identify not only direct suppliers to exporters but also firms supplying these suppliers and beyond. Around 17% of firms in our data set are exporters. So-called L1 suppliers, which supply directly to exporters without exporting themselves, account for over 40% of the total (see Figure 5.1). L2 suppliers, those supplying to L1 firms (but not directly to exporters or exporting themselves) represent a smaller group (7%). Similarly, we identify L3 suppliers, which form an even smaller group (less than 1%). Firms in the L4+ group, which are minimally connected to exporters, comprise about 30% of the total firm population. Together, exporters and L1 suppliers account for around 60% of total number of firms, 80% of the total added value and employment (Figure 5.1).

[13] Re-exports are excluded from our analysis. Firms solely engaged in re-export activities are therefore not classified as exporters.
[14] In the literature, such firms are referred to as *perennial exporters* (see van den Berg et al., 2022).

Figure 5.1 Exporters and their L1 suppliers constitute 60% of the firm population, 2018

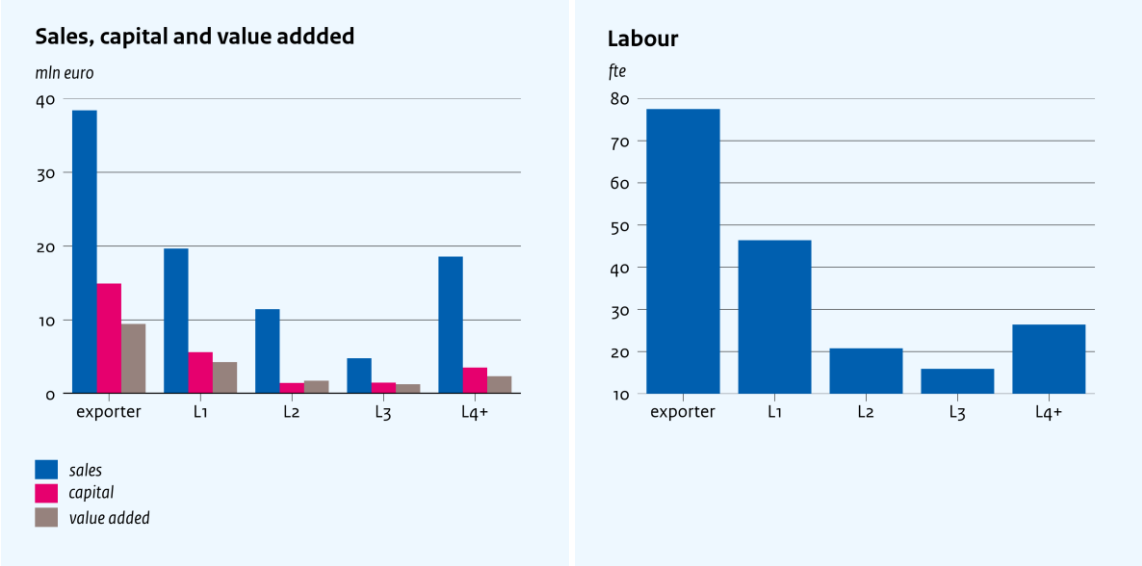


5.3 Results

Exporters are typically larger and more productive than non-exporters. They employ more workers, generate higher revenue, add more value, and maintain larger stocks of capital goods (see Figure 5.2). On average, exporters employ two to three times as many workers as non-exporters, enabling them to generate three to four times more revenue and value added. This higher value added per employee reflects their higher productivity. These findings align with existing literature, such as Bernard and Jensen (1999), which consistently shows that exporters globally tend to have more employees, larger capital stocks, and higher productivity than non-exporting firms. This higher than average productivity level is not so surprising given that exporting to markets beyond your domestic home market typically entails overcoming significant fixed costs due to international trade hurdles such as trade and transport costs, but also information, search and advertising costs.

Direct suppliers to exporters (L1) are also generally larger and more productive than firms that do not supply directly to exporters, although they are still smaller and less productive than exporters themselves. Our new finding is that suppliers to exporters are also larger and more productive than the average firm. L1-suppliers, on average, employ twice as many workers, generate double the revenue, and create two to four times more added value than firms not directly connected to exporters (see Figure 5.2). Their capital stocks are also two to three times larger. However, exporters outperform L1 suppliers across all these dimensions. Together, exporters and L1 suppliers form the most productive group of firms in the Netherlands. Firms further removed from exporters—such as L2 and L3 suppliers—are smaller and less productive than both exporters and L1 suppliers. The L4+ group includes a mix of firms, some of which are large retailers and wholesalers. These larger firms raise the group's average figures for employees and revenue, even though many other L4+ firms are smaller and less productive.

Figure 5.2 Exporters are larger and have more capital than other firms, 2018



Note: Average values per group.

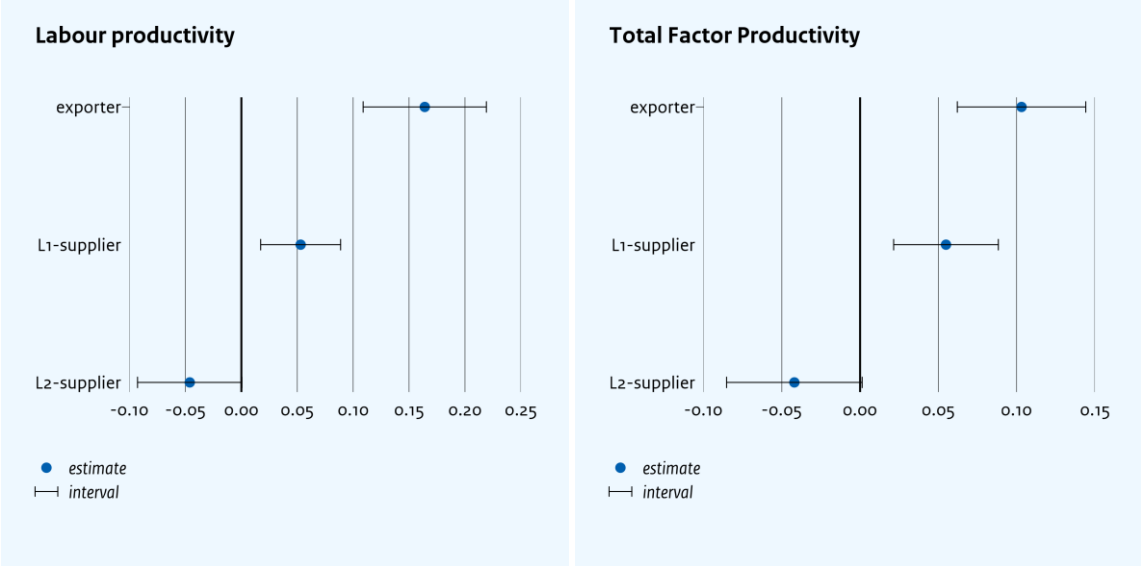
We perform several regression analyses to further examine differences between firms. The above figures compare firms of varying sizes and industry . Regression analysis allows us to control for the number of employees and industry fixed effects, creating a better comparison between groups. This approach ensures that comparisons between supplier groups are not biased by one group having more large firms or firms from specific industries.

Regression analysis enables the comparison of different groups of firms. The coefficients in Figure 5.3 represent the level difference relative to the L3+ supplier group. Given the small number of L3 suppliers, we combine them with the L4+ suppliers into a single group, together called L3+ group. So if we analyse labour productivity and find that the coefficient for exporter status is positive and statistically significant, this indicates that exporters, on average, have higher labour productivity than the L3+ group. The coefficient of each group reflects the percentage difference with the L3+ group. We stress that this analysis does not establish causal relationships.

After adjusting for various firm characteristics, exporters remain the most productive group, followed by their direct suppliers. Figure 5.3 presents the regression results for both labour productivity and TFP, with exporters showing the highest coefficients. On average, exporters are 11% to 18% more productive than the L3+ group. Direct suppliers (L1) are also more productive than other firms, by around 5% on average. Indirect

suppliers (L2), however, do not exhibit higher productivity than other firms. A clear pattern emerges: exporters are the most productive, followed by their suppliers, and then the rest.

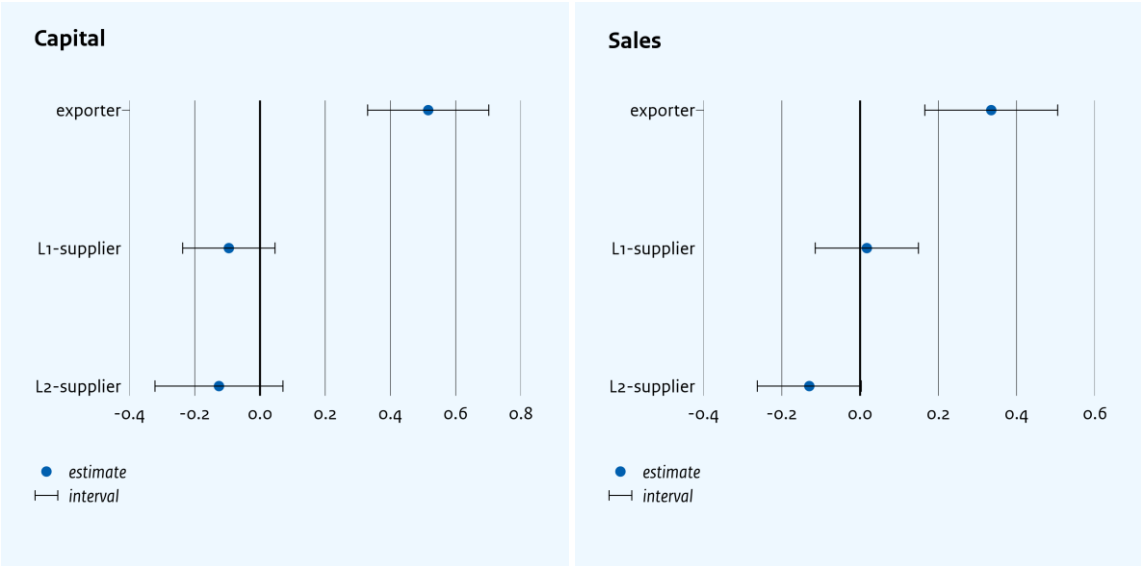
Figure 5.3 Exporters and their suppliers have higher productivity



Note: the whiskers show the 95% confidence interval

Exporters are not only more productive but also generate higher revenue and utilize more capital goods. Figure 5.4 presents the regression results for both sales and capital intensity. Compared to productivity, the patterns for sales and capital differ: exporters achieve the highest sales and have the largest capital stock. On average, exporters use nearly 70% more capital goods and generate 40% more sales than the L3+ group.[15] However, their direct (L1) and indirect (L2) suppliers do not have significantly more capital goods or higher sales. This indicates that exporters use their extensive capital stocks to achieve higher productivity than non-exporters.

Figure 5.4 Exporters are also larger and utilize more capital



Note: the whiskers show the 95% confidence interval

[15] A coefficient of 0.52 implies that capital is around 70% larger ([exp(0.52)-1]*100).

5.4 Explanations

The productivity hierarchy of firms in export networks is not unique to the Netherlands. For example, Dhyne and Rubínová (2016) show that exporters and their suppliers are larger and more productive than other firms in Belgium. There is also a clear hierarchy: exporters are larger and more productive than their suppliers, who, in turn, outperform their own suppliers. Similar trends are reported for Japan (Ito & Saito, 2021). At the industry level, Merlevede and Theodorakopoulos (2021) observe comparable patterns across a broader set of countries.

Selection, economies of scale, and learning effects may explain why exporters tend to be larger and more productive than other firms. Three main drivers of differences between exporters and non-exporters are suggested in the literature. First, according to the *selection effect*, exporters face intense international competition, meaning only highly productive firms can afford to export (Melitz, 2003). Firm size is also critical, as shown by Brakman et al. (2020), who emphasize that firm size significantly impacts the likelihood of starting to export. Second, exporters access larger markets, enabling them to achieve *economies of scale* and lower production costs (Krugman, 1980). Third, by interacting and collaborating with foreign partners, exporters *learn* new techniques or methods, leading to productivity gains (Atkin et al., 2017; CBS, 2022a; De Loecker, 2013). Thus, exporting not only attracts productive firms but also enhances their productivity over time.

Similar factors apply to suppliers of exporters. Productive exporters are likely to invest more in identifying and collaborating with the most productive suppliers, creating a mutually beneficial selection process (Bernard & Moxnes, 2018). Additionally, exporters' economies of scale may benefit their suppliers by increasing the demand for intermediate goods, which boosts suppliers' production efficiency. Lastly, suppliers may adopt new techniques and practices through their partnerships with productive exporters, further improving their own productivity. Empirical studies confirm that exporters often assist suppliers in delivering higher quality and encourage continuous improvement (Alfaro-Ureña et al., 2022).

The relationship between exporters and their suppliers is mutually beneficial. Exporters gain advantages from working with productive suppliers, as highlighted by Bernard et al. (2022) and Bernard and Moxnes (2018). Their model describes how marginal costs of an exporter depend on supplier pricing. Productive suppliers offer lower prices, which keeps costs in the supply chain low. As a result, firms with productive suppliers in their value chains are more competitive than those without such networks. Additionally, productive firms attract more customers and achieve higher sales per customer.

5.5 Conclusion

Exporters play a crucial role in the Dutch economy, extending beyond their function as employers and customers of domestic suppliers. They make a significant contribution in particular to productivity, not only through their own performance, but also possibly by enhancing performance of suppliers. Exporters are the most productive firms in the Netherlands, followed by their suppliers, who also perform above average. The findings suggest that the closer a firm is connected to the export sector, the more it can benefit. Firms gain from exports through various channels, each with distinct policy implications.

The insights from this study are relevant to several policy debates. Policies affecting exports and exporters have broader impacts, influencing not just the export sector but the wider economy. To boost productivity, the

government could, for instance, focus on promoting knowledge diffusion from successful exporters to other firms or facilitating stronger connections between firms. Additionally, stimulating the export sector itself can indirectly drive growth across the broader economy. Effective policy design requires a deeper understanding of productivity spillovers from exporters to their suppliers and beyond. Future research should explore these channels in detail.

Future research will delve further into the differences between exporters and their suppliers, with particular emphasis on the diversity within these groups. First, investigating how suppliers benefit from their relationships with exporters will help design more targeted pro-productivity policies. Second, identifying which firms derive the most advantage from working with exporters—considering factors like firm size, industry, export destinations, or specific products—will clarify the links between (indirect) exporting and productivity. Finally, examining non-export-connected firms will provide insights into their role in the economy. These insights will contribute to the development of more focused policies that support productivity and economic growth in targeted areas of the economy.

Markets reacted with relief after France avoided a rating downgrade, but the story remains unchanged. With plenty of political risks ahead, we remain wary of wider spreads

French bond spreads extended Friday's relief rally. The 10y OAT/Bund spread narrowed by more than 10bp to below 155bp. Not long ago, it was trading at its widest level since 2011. The trigger was Moody's refraining from downgrading France, which still holds its double-A rating. It still comes with a negative outlook, though. And eventually, France still needs to make a "significant and sustained fiscal effort" to avoid a downgrade.

Fragmented politics and public unrest over the past weeks highlight the challenge. We do not believe that we have seen the end of the French market turmoil with uncertainty ahead of the elections next

April. A tail risk remains that public discontent is channelled into more support in the presidential election for far-left firebrand candidate Melénchon.

For the ECB meeting this week, the latest retightening is still welcome news as it removes some pressure for an interest rate hike. Officials will almost surely be asked how they would treat the issue if it were to escalate. This gives them more room for constructive ambiguity, and would support our view that markets are unlikely to find a reason for turning bullish at the meeting. Elevated energy prices and resilient data outside of France argue for continued hawkish pressure on front-end rates.

FX markets face a busy week full of central bank meetings, data releases and politics. With energy prices firm and expectations growing that the US and Israel will launch another attack on Iran, we expect central banks to stay hawkish. This should keep the dollar supported on dips. Expect Brazilian assets to sell off today on President Lula's surprise win

USD: Geopolitical environment remains dollar positive

The dollar is starting a busy week relatively supported. It is a week that includes key events such as Wednesday's FOMC meeting, third-quarter earnings from big tech companies and geopolitical events, including tomorrow's elections in Israel. There are also a whole host of central bank meetings across G10 currencies, including those in the eurozone, Japan, Canada and New Zealand.

The balance of risks suggests that the dollar can probably hold onto its gains. Yes, interest rate spreads have moved a little against the dollar as the recent US tech wobble has pared back Federal Reserve tightening expectations. But energy prices remain at their highs, and the arrival of a third US aircraft carrier group in the Gulf makes further escalation in the Middle East more likely than not.

Barring some clearly underwhelming 3Q results from the likes of Alphabet and Microsoft on Wednesday, we think higher energy prices and a hawkish Fed can keep the dollar supported this week. That means the DXY dollar index can probably stay in a 101.45 to 101.85 range today. We don't really see the need for it to correct l

euro. That seems unlikely, and high energy prices are hardly helping.

On the subject of energy, last week's release of the eurozone current account surplus for August at just €8.7bn (the lowest since the start of 2023) provided a reminder of the toll higher energy prices are taking on the bloc's external position. This, alongside a U-turn in Fed policy, had contributed to a very weak EUR/USD at the time.

Today's session is expected to see stable German Ifo business sentiment, where the important expectations component is seen at a healthy level near 90. Any downside surprise here could hit the

euro. And while the recent 10bp narrowing in EUR/USD two-year swap differentials might make the case for a slightly higher EUR/USD, we see plenty of justification for a 1-2% risk premium to stay in the euro.

We favour 1.1250/70, capping EUR/USD upside in the near term, and see the 1.1180 support level as vulnerable this week.

Chris Turner

CEE: Zloty remains the weak link

The significant deterioration in global sentiment last week has only i… …e r… w… B…

T… C… C… fr… a… s… a…

I… …d o… i…

We anticipate a rate hike at the November meeting, with the CNB currently preparing the market for such a move.

On Friday, EUR/PLN tested new highs since 2023 and broke through the key 4.400 level. We have long identified the zloty as the most vulnerable currency in the region, and given its rate outperformance relative to CEE peers, there is likely further upside for EUR/PLN. Friday's inflation data from Poland could help stabilise the market. EUR/CZK also decoupled from the interest rate differential; a hawkish CNB should help the pair return to the 24.250–24.300 range. EUR/HUF is gradually approaching 368, a level where we expect new sellers to emerge.

BRL: Lula comes back from the brink

In a huge surprise, incumbent Brazilian President Luiz Inácio Lula da Silva has won the presidential election run-off with 51.8% of the vote. This is the first time since 1989 that a second-placed candidate has come from behind to win the run-off. The victory is not without its controversy, however. The opposition candidate, Flavio Bolsonaro, wants the election result annulled since a Supreme Court judge extended polling hours at the last minute. Some polls had already closed, and claims are that the polls that w

Belgium retains its AA- rating from S&P, but fiscal challenges persist. Coalition talks on a €10bn savings package remain deadlocked, putting the 2027 budget at risk. With the deficit struggling to fall below 5% of GDP, a credible deal is crucial to reassure bond markets and stabilise the debt ratio

No rating change for now

As expected, S&P affirmed Belgium's sovereign credit rating at AA-, with a stable outlook (a relief given the current budgetary challenges). It remains the only one of the three major rating agencies to place Belgium in the double-A category. The rationale is unchanged: Belgium's economy remains resilient and diversified, while the government's efforts to contain the widening fiscal deficit and the Federal Debt Agency's strategy of extending debt maturities also support the rating. Yet these factors will not be enough to bring down the deficit, which will struggle to fall below 5% of GDP, or stabilise the debt-to-GDP ratio.

In the near term, S&P doubts that the federal government can finalise its 2027 budget on time. The precedent is hardly reassuring: the 2026 budget was only finalised in March 2026.

The clock is ticking

That brings us back to the ongoing coalition talks. The parties had agreed to negotiate a €10bn savings package to be implemented over the next three years, avoiding difficult budget negotiations too close to the next election campaigns. As elections approach, parties typically find it harder to compromise or concede ground on policies that are important to their voters.

sustainable path and demonstrate that Belgium can still make decisions, in contrast to France's partisan divisions and political uncertainty.

But a deal remains elusive, with each party holding to mutually incompatible red lines. This week could therefore prove decisive. An agreement would give Belgium a budget for 2027 and a clear fiscal roadmap for the years ahead, sending a strong signal to financial markets. If talks drag on, however, finalising the budget before year-end will become difficult, as S&P warns. Tensions could then intensify, as the prime minister has ruled out entering 2027 without a budget. We will be watching the negotiations closely. The

stakes extend beyond the budget: in an increasingly nervous bond market, government credibility is crucial.

Fed officials play for time

The immediate reaction to the surprise September 0.3% month-on-month core CPI print was to send the chances of an October rate hike above 50%. But this didn't last long. Earlier comments from Federal Reserve Vice Chairs Philip Jefferson and Michelle Bowman and Governor Chris Waller, signalling no rush to decide on the next policy move, quickly calmed markets. The fact that Fed Chair Kevin Warsh subsequently chose not to talk up the chances of action when he spoke at the IMF meetings in Bangkok, unlike at the

Jackson Hole Conference before the September hike, further dampened the perceived chances of action.

While it is true to say that recent jobs numbers have been disappointing and interest rate-sensitive sectors, such as the housing market, are experiencing increasing pain, the economy is growing robustly, and inflation remains above target. Fed officials themselves have made it clear that they think more tightening of monetary policy is going to be required to bring inflation to heel. Given that the latest Federal Reserve Summary of Economic Projections showed four FOMC members projecting 50bp of rate hikes between now and the end of the year, the decision is unlikely t

dollar are tightening financial conditions to a degree, our forecast path for the Fed assumes that in the couple of months following the midterm elections we see an agreement that improves the flow of energy from the Persian Gulf, but significantly, also allows for a sharp reduction in shipping and insurance costs. It's the latter point that is crucial to delivering lower pump prices at a time when refineries are working at capacity. If correct, this should meaningfully ease inflation pressures, and with US wage growth (the biggest cost input for corporate America) looking very benign at just 3% and the largest component of the inflation basket – housing at 35% by weight – set to experience more disinflation, we

believe overall US inflation can fall back to 2% in the second half of 2027.

The risk to our view is clearly tilted towards a longer-lasting conflict rather than one that is resolved imminently. This means we would not rule out additional hike(s) in 1Q 2027, but with households experiencing a greater squeeze on spending power (weak wage growth amid rising energy costs) and bond yields likely pushing even higher – leading to new cycle highs for mortgage rates and corporate borrowing costs – the risks of a weaker economy will increase. As such, in this more stressed economic scenario, eventual cuts to policy rates will likely be swifter and more s

bond angst. And at the margin, it can add to systemic pressure. This is not the type of environment where the Fed would be inclined to add to concerns by tightening policy. It's the perfect meeting to keep rates on hold.

Whether we remain below 5% for the 10yr yield is a whole other question. We're minded to expect it to snap back above, as we still have inflation, fiscal deficit, and AI-boom impulses at play. The Fed will no doubt remind us of these ongoing pressures. Plus, a break back above 5% will likely need a degree of calm in the risk space first. We think it should ultimately move back above 5%; the timing,

however, is a tougher call. That being said, this is not the meeting to rock the boat on the bond market.

We're likely still some way from the Fed spelling out a plan to shrink its balance sheet, which we know remains a policy objective for Chair Warsh. We expect recommendations from the various committees to surface closer to the turn of the year. Meanwhile, liquidity circumstances are stable, with repo behaving far better than it did a year ago.

Warsh FOMC meetings have set the dollar tone since June

We suspect that Warsh has learned from the criticism he received over July's FOMC meeting, where he implied that the bond market was doing the tightening (read as the Fed would not have to). That probably means he will not be drawn into concluding that wider credit spreads and softer equity prices mean tighter financial conditions now require fewer Fed hikes.

Assuming that Warsh sticks to the script that monetary policy credibility remains the Fed's top priority, short-dated US yields can remain well-supported, and the dollar can largely hold on to the gains it has made since early September. And the euro looks like it

has enough trouble with higher energy prices and French political risk to drag EUR/USD back to the lows of the year near 1.11.

Warsh FOMC meetings have set the DXY dollar trend

USD: Losing safe-haven appeal

Yesterday was a rough session for risk sentiment, as global equities sold off on a combination of higher oil prices and AI-related concerns. FX moves confirmed that the dollar is far from the preferred safe haven at this stage, with the yen and Swiss franc emerging as the main beneficiaries of the defensive rotation.

Crucially, the negative correlation between bonds and equities is reasserting itself, and FX markets are taking their cues from that dynamic. 10yr Treasuries broke back below 5.0% for the first time

in a month, showing ever-reduced sensitivity to higher oil prices. The same dynamic is visible at the front end, where the 2yr SOFR swap rate dropped 15bp to 4.50% yesterday. That suggests equity jitters are enough to dent market conviction on a large Federal Reserve tightening cycle.

Still, the bar for pricing out a December Fed hike appears fairly high, which should prevent larger USD corrections for the moment. Any stabilisation in risk sentiment can help USD consolidate across most pairs and take some shine off JPY and CHF. But the FX reaction function to further risk sell-offs is now looking much clearer.

probably a function of OAT's simply having a higher beta to global factors and perhaps some concerns about another weekend of social unrest in France.

The euro's sensitivity to France has clearly diminished, with the common currency not materially underperforming G10 peers yesterday. That link may, however, re-establish very rapidly should a new pain level – perhaps 200bp – be breached. We aren't expecting that much further widening for now, but the risks are clearly there, and the euro remains rather unattractive across the board.

EUR/CHF remains the cleanest way to play European sovereign risk at the moment, while EUR/USD should be quick to re-test the 1.1120 14 October low should bond turmoil persist. Today's PMIs will probably play a secondary role to France, which faces a Moody's credit review, and global equities. Expectations are for slightly softer numbers compared to September.

subsequent comments from other officials are likely to be more hawkish. This supports further strengthening of the koruna, despite a significantly negative global environment; consequently, we could see a test of the 24.200–24.250 range.

EUR/RON has normalised, returning to the 5.340 level, following the parliament's vote of confidence in the new technocratic government. As we noted previously, we do not expect the new government to trigger an FX rally, but rather to foster stabilisation around current levels. This remains our baseline view, though the risk remains tilted to the upside for EUR/RON should political uncertainty return.

On the bearish side, the Polish zloty and the Hungarian forint remain particularly vulnerable. They may face further downside, given the absence of a hawkish stance from their respective central banks, combined with high exposure to energy imports and rising energy prices. The upside for EUR/HUF should be capped in the 368-370 range, supported by a local, idiosyncratic narrative; we would expect to see new sellers of EUR/HUF emerge there. Conversely, EUR/PLN lacks this benefit and remains exposed to the upside.

current fundamentals than by mounting supply concerns. Markets are increasingly worried about renewed escalation in the Persian Gulf, a scenario that could threaten oil flows that have so far remained remarkably resilient.

Reports suggest President Trump is considering fresh strikes on Iran, while the US is reinforcing its military presence in the region with the deployment of a second aircraft carrier. Meanwhile, there are reports that US troops have been evacuated from some bases in the Middle East. Clearly, these developments don't paint an optimistic picture. They call into question our long-held view that the US midterm elections would bring de-escalation and

normalisation in flows and oil prices. If anything, re-escalation seems the most likely path. As a result, our expectation that ICE Brent would average $80/bbl over 4Q26 is looking unattainable. Even if tensions don't re-escalate, the mere possibility is likely to keep a sizeable geopolitical risk premium embedded in prices.

European gas prices also remain extremely sensitive to developments in the Persian Gulf, with LNG flows increasingly likely to be largely absent from the market for at least much of the Northern Hemisphere winter. TTF rallied 3% yesterday, settling above EUR90/MWh, its highest since December 2022. EU gas storage also appears to have peaked at just under 75% full, with s

Friday brings the release of the preliminary Q3 GDP estimate. We expect agriculture to have weighed heavily on growth in the third quarter, but industry – mostly driven by the new export capacities – should largely offset this. Services will remain a major positive contributor.

As this is only a flash estimate, the data will provide few details. Even so, annual growth should remain robust despite the quarterly slowdown. We therefore maintain our full-year growth forecast of 1.9% and continue to expect growth to pick up in the final quarter of the year.

Czech Republic: Confidence likely to weaken as growth softens

Monday brings the release of October confidence indicators, and on Friday we'll get the preliminary 3Q26 GDP estimate. We expect economic performance to have weakened further on an annual basis in 3Q26, but quarter-on-quarter growth should have picked up thanks to a pre-stocking effect triggered by the Hormuz conflict. Large numbers of people submitted new orders when it became clear that prices would rise and products would become more scarce.

rates remain high, and domestic bank funding continues to materially outperform lending growth, pointing to restrictive monetary conditions. We therefore see a hold as a tactical pause before gradual easing in the medium term.

The Central Bank of Azerbaijan announces its latest interest rate decision on Thursday. We expect the CBA to keep the refinancing rate unchanged at 6.50%, as inflation remains within the 4±2% target range. Headline CPI eased to 5.5% YoY in September, arguing against tightening. However, CPI remains relatively close to the upper end of the target range, while domestic producer-price

pressures, solid credit growth and an increasingly pro-inflationary global backdrop warrant caution. We therefore retain our medium-term call for rates to remain at 6.50%, although the relatively low real policy rate leaves some risk of an upward revision to the rate trajectory should global inflation prove more persistent.

for longer and core inflation expected to increase in 2027, the stage seemed set for at least one more rate hike at the December meeting. Some even speculated about a back-to-back increase in October.

One month later, and after a severe fiscal and political crisis in France, the ECB is unlikely to repeat the hawkish tone at next week's meeting. At face value, macro developments since the last meeting would still justify another rate hike. Headline inflation increased again in September and most leading indicators point to continued resilience in the eurozone economy. However, the surge in bond

yields on the back of the French crisis is already imposing a new restrictive monetary policy stance. In fact, the surge in German bond yields since the September meeting has already had roughly the same impact on growth and inflation as an additional 25bp rate hike. For France, it's closer to a 50bp hike. Or in other words, the bond market has taken over the ECB's job.

All of this means that the ECB is very likely to stay on hold next week and will delay any next rate hike decision to December. This is when new staff projections will be available and when there will also be more insights into whether higher energy prices will eventually bring knock-on effects on the rest of the economy or

next week, it will be an important element at the press conference. Political and fiscal concerns in France, and the resulting widening in French spreads, have raised questions about whether the ECB could intervene through the Transmission Protection Instrument (TPI), which allows it to purchase securities issued by member states whose financing conditions have deteriorated for reasons not justified by country-specific fundamentals. However, before activating it, the Governing Council considers a cumulative set of criteria to determine whether the countries concerned are pursuing sound and sustainable fiscal and macroeconomic policies. In practice, this includes compliance with the EU fiscal framework,

which would, at a minimum, require the proposed French budget to be fully adopted.

The ECB has nevertheless left itself some discretion, stating that the intervention criteria “will be dynamically adjusted to the unfolding risks and conditions to be addressed”. This brings back memories of the famous “because it’s France” by former European Commission President Jean-Claude Juncker. Generally speaking, the ECB will be in a difficult position: intervening too quickly in support of France may be viewed unfavourably by other member states and interpreted as monetary financing of the debt of a country unwilling to follow the rules. That argues strongly against early

notably, which will slow growth and reduce pass-through by more than projected in our September exercise".

2. The second line of defence would be a covert return to bond purchases. The ECB could instead pause quantitative tightening temporarily and reinvest maturing bonds in its portfolio 'flexibly', sending a positive signal to bond markets. This had already happened during the Covid period.
3. Last but not least, should contagion in eurozone bond markets intensify, we expect the ECB to eventually trigger the TPI. As long as France remains non-compliant with the European fiscal

rules, the ECB might even consider purchasing bonds from almost all eurozone countries, except for France.

All in all, next week's ECB meeting looks set to be uneventful on action but clearly not on words.

The US 10yr back below 5% - let's see how it feels down there

The US 10yr yield broke back below 5% around midday in New York trading on Thursday. And did so with a degree of conviction. We thought 5% could hold, but always acknowledged that a heightened (and still heightening) risk-off tone could in the end dominate, at least for the near term. The fact that the French 10yr has gone the other way and shot above 5% in recent days, and the spread out to 175bp vs Germany, is also of relevance. We also note

that Thursday was the first day of pronounced flight into Bunds since the French wobbles took hold. Treasuries have shared in this.

Whether we remain below 5% is a whole other question. We're minded to expect it to snap back above, as we still have inflation / fiscal deficit / AI boom underpinnings to navigate. And we have the US mid-term elections approaching as an excuse for trouble. But it will need some degree of calm in the risk space first. What happens on Friday is anyone's guess, and it may well be that longs in cash bond duration offer comfort to most through an uncertain weekend. We'll see. We still think the 10yr yield gets back above 5% ultimately. The timing for that is a tougher call.

French downgrade lurking and risk sentiment not helping French spreads either

Amid all this, French bonds remain in the line of fire with the spread over Bunds widening at times by 15bp, with the spread touching 177bp. That is still below its late-2011 peak of just under 200bp, but at this pace it is only a matter of days before we see a new high. Although a lot has changed in the eurozone since 2011, some may consider Italy's spreads during the sovereign debt crisis the better yardstick since it was the country in market focus back then and not France.

That said, the latest widening seems to be more driven by the deteriorating general sentiment, as there were no significant news headlines out of France. But the prospect of ongoing uncertainty until the presidential elections keeps investors sidelined. And French bonds can't really benefit from any recovery in general sentiment, leaving spreads at wider levels. For now, it feels like watching a train wreck in slow motion where we have not seen the end of the widening yet.

One event that market observers have been looking forward to is the scheduled rating review by Moody's after markets close on Friday. Moody's still has France on Aa3 with a negative outlook, and t

Friday's events and market view

PMI data on Friday will be the next test for markets. So far, both equity markets and economic data point to a resilient economic outlook, but this narrative is challenged by rising rates and higher oil prices. Concerns about AI valuations are a recurring daily theme while energy prices keep drifting higher. If we were to also see headwinds materialising in the economic data, we could face quite a bullish repricing in rates. Especially for euro rates, a more downbeat growth

outlook combined with the French turmoil would be reasons for markets to turn more dovish on the ECB.

French PMIs for October are expected to remain above 50, but these numbers will not incorporate the latest unrest. Consensus sees the eurozone aggregate number softening slightly, but a composite index of 52.7 would still be well in positive territory. Also, US PMIs will be watched as these moved markets quite significantly last month with the composite number rising to a strong 58.4.

We expect EUR bank bond supply to reach €450bn in 2027. Redemptions remain the main driver of the high supply, but the modest macroeconomic outlook is not expected to push supply up any further. We foresee covered bond issuance reaching €185bn, senior unsecured bond supply at €210bn and another €55bn in subordinated bank bonds to be printed

Variables driving next year's bank bond supply

We expect EUR bank bond supply to reach €450bn in 2027, down slightly from the €455bn forecast for 2026. In our view, several variables will be steering next year's issuance.

Redemptions will remain the central driver of the elevated 2027 bank bond supply forecast. Nearly €400bn of bonds mature in 2027, up €30bn year-on-year and the highest level in a decade.

The increase is especially significant in the covered bond segment where €186bn will mature, a historic high.

The subordinated segment will also rise, with redemptions totalling €45bn, up about €6bn from 2026. Of this total, €31bn is in Tier 2 instruments and €14bn in AT1s. The senior unsecured segment will partially offset these increases, with total redemptions reaching more than €162bn, down from more than €170bn recorded this year. The majority stems from senior bail-in bonds (senior non-preferred or senior HoldCo) with more than €90bn and an additional €71bn maturing in senior preferred instruments.

While high redemption levels point to stronger supply in 2027, other factors also play a role, such as the macroeconomic environment. Eurozone GDP growth is forecast to increase slightly in the second half of next year to reach 1.5%, still well below levels seen after the pandemic.

Furthermore, our economists pencil in an additional European Central Bank rate hike in 2026, bringing policy rates to 2.75% in early 2027. The higher interest rate environment is not expected to

support lending growth, especially as geopolitical instability remains. As a result, we do not see the modest macroeconomic backdrop acting as a catalyst for bank bond supply in 2027.

led to spreads widening again. The combination of French political uncertainty and the Middle East conflict could trigger some periods of volatility in the market in 2027. However, we believe these uncertainties will not be a strong negative for bank bond supply. Depending on the timing, though, periodic widening may make financial institutions less keen to pre-fund redemptions coming up in 2028.

Our 2027 supply forecast

When accounting for these three main variables, we expect the EUR bank bond supply to reach €450bn in 2027. This translates into a net supply of €57bn, down from €89bn in 2026.

Forecast EUR bank bond supply for 2027

bond issuance. Besides, with the securitisation package entering its finalisation stage, issuers with high funding needs may shift some secured issuance towards securitisation for diversification purposes. Increasing demand for covered bonds from overseas investors driven by regulatory developments may also result in more currency diversification, away from EUR-denominated issuance.

We forecast senior unsecured supply to reach €210bn next year. This is split between €70bn in senior preferred bonds and €140bn in senior bail-in instruments. It represents a €10bn YoY decline in

senior preferred supply, reflecting both the drop in the segment's redemptions from 2027 onwards and the potential impact of the Crisis Management and Deposit Insurance (CMDI) framework. As the CMDI reforms are expected to enter into force in 2028, they could reduce the attractiveness of senior preferred bonds versus senior bail-in instruments in some EU countries, as senior preferred exposures will rank lower than, and no longer pari passu to, uncovered deposits in the creditor hierarchy. The funding cost advantage of senior preferred unsecured issuance could decline. At the same time, issuing senior non-preferred bonds could serve the purpose of increasing the bail-inable layer protecting preferred s

redemption levels. With AT1 redemptions in 2027 increasing by €3bn YoY to €14bn, net supply is likely to be marginally higher next year. In Tier 2, redemptions increase by €4bn to €31bn, essentially meaning that net supply will only be marginally higher.

As the chart below highlights, net supply in AT1 has been significant in recent years but has slowed this year as the focus has shifted towards refinancing. As such, while we expect more AT1 supply next year compared to 2026, the levels are relatively in line with the longer-term trend.

Forecast EUR AT1 supply (€bn)

complementary role in capital management, and we do not expect it to have a major impact on bank capital issuance in 2027.

Bank M&A could also be a wildcard for 2027 issuance. With several large M&A transactions potentially taking place, this may lead to some capital optimisation and less incremental supply needs; conversely, goodwill effects, potential regulatory increases in buffer requirements or RWA inflation may lead to a slight increase in the need for capital. However, on the whole, we would expect M&A to have a slight dampening effect on supply.

Finally, spreads are currently quite elevated, and coupons on new issues are generally higher than legacy bonds maturing or callable in 2027. This may also lead to a more wait-and-see approach from issuers, but we still think that most issuers will continue to drive their capital plans as in previous years.

Forecast EUR bank bond supply for 2026

	FY 22	FY 23	FY 24	FY 25	FY 26F	FY27F	2025 YTD	2026 YTD

We predict another year of strong supply for the European TMT sector. We expect €150bn of gross issuance and €103bn of net issuance, given €47bn of debt redemptions. The additional issuance is not coming from the traditional telecom or media issuers, but from global tech companies.

As we expect the data centre build-out to continue in 2027, issuers are likely to return to the European investment-grade credit market to raise part of the required funding. Meanwhile, we do not see a major reason for traditional sectors to reduce or increase

indebtedness, as factors driving indebtedness higher are countered by factors driving debt lower, as we'll explain below.

European investment-grade TMT supply (€bn)

in FY27.

Low-single-digit EBITDA growth gives companies some capacity to issue additional debt while maintaining stable leverage. However, higher interest rates provide an incentive to keep debt levels in check. We therefore expect the increase in debt issuance to be driven mainly by M&A. Several debt-funded acquisitions of smaller networks could generate around €5bn of net issuance. A further €3bn could come from US operators raising euro-denominated funding for spectrum payments in 2027.

Technology supply

In 2027, we believe the AI build-out will continue. Tech companies currently report healthy returns on investment, demand for AI services continues to outpace supply, and companies want to maintain their market positions. We therefore expect further capex growth in 2027, with the large hyperscalers investing close to US$1tr in fiscal 2027.

As in 2026, we expect these companies to finance their investments largely from operating cash flow, but also through debt issuance, with additional funding coming from European

on future funding plans, as spreads may only tighten once the market no longer expects substantial new supply. Nevertheless, current spreads look attractive relative to the issuers' high ratings, with much of the widening driven by supply and liquidity effects. Relatively wide CDS spreads also suggest that technical factors, rather than a material deterioration in credit risk, are weighing on valuations. This combination of high credit quality and attractive spreads should attract new money to the investment-grade market.

Challenge 1: Does debt issuance reduce credit quality?

First, we expect the hyperscaler data centre operators Amazon, Microsoft, Alphabet, Meta and Oracle to grow their combined EBITDA by US$230bn, or 29%, in FY27, to around US$1tr. Moreover, with the exception of Oracle, these companies are expected to operate with limited net debt, with Microsoft holding more cash than debt. The main caveat is their significant lease commitments, many of which are not yet reflected in balance-sheet lease liabilities because the underlying leases have not commenced. Given our aggregate EBITDA projection of around US$1tr for fiscal

accommodate more supply?

Do European credit markets have the capacity to absorb additional supply from technology companies? We think the current share of technology issuers remains modest. Alphabet accounts for only 1.16% of the iBoxx € Non-Financials index, while Amazon and IBM account for 0.68% and 0.91%, respectively.

In the US, Oracle's share of more than 2% in the iBoxx $ Domestic Non-Financials index illustrates that individual technology issuers can reach materially higher benchmark weights, while several high-

yield indices apply a 3% issuer cap. In addition, many large technology companies have not yet raised funding from European credit markets.

We therefore see significant room for technology companies to increase issuance in European investment-grade markets. The inclusion of eligible new bonds in benchmarks also creates a strong technical incentive for benchmark-aware investors to participate in new deals, as not owning the bonds could increase their tracking error.

Benchmark sizes selected TMT names in E

Summary

The CEE region has been hit hard by a further energy shock. Yet despite the challenging macroeconomic environment, much of the region has shown greater resilience than expected. Our main article in this publication argues that the next stage of that resilience will depend increasingly on Outward Direct Investment (ODI), as CEE economies seek to evolve beyond a low-cost, FDI-to-export, strong SME-based model of growth.

Looking at the CEE4, we discuss why the next leg of the region's growth journey will involve developing successful multinationals. Countries could do more in this regard as their ODI remains well below the levels implied by their stage of economic development.

So far, policymakers have focused primarily on attracting FDI and promoting exports. Going forward, they need to broaden this institutional framework to facilitate the foreign expansion of domestic firms, for example through market intelligence, access to financing and risk-sharing instruments, legal and regulatory support, and economic diplomacy. Ultimately, firms themselves need to recognise the opportunities offered by becoming multinational.

This is certainly the message we are hearing from our own corporate surveys, for example in Poland, where foreign expansion is now seen as a necessity to break out of relatively small domestic markets to diversify customer bases, spread fixed costs over greater sales and increase the returns on investment in innovation and digitalisation. The Czech Republic seems to have made the most progress with ODI, while Poland and Romania lag. All countries could do more.

Coming back to the immediate outlook for the region, we see a mixed picture heading into 2027. Poland is expected to remain one of the fastest growing economies in the EU, albeit with fiscal frailty. Parliamentary elections next year mean there will be little appetite for fiscal consolidation, and the focus will remain on the sovereign bond market, where downgrade risks remain and foreign holdings are low. Even though we expect 50bp of rate hikes locally, we see the zloty staying relatively soft.

Hungary should enjoy an improving growth rate and a better fiscal position. The path towards euro adoption, which we see happening in 2032 at the earliest, would require a lower inflation target and a credible medium-term fiscal framework. These policy shifts could create room for 125bp of rate cuts by the end of 2027. Positioning on this theme is already crowded, but local currency bond yields should soften further and EUR/HUF should stay near 350/360.

Czech activity is set to slow next year on the back of softer real wage growth, but the manufacturing sector has been holding up reasonably well. We see the Czech National Bank as one of the most hawkish in the region, having already hiked this year. At least another 25bp of tightening by year-end should see ongoing demand for the koruna.

In Romania, the bond market continues to teeter on the edge of junk status. If a stable government can be formed, further fiscal improvement can win through and be rewarded with lower funding costs. This could end three years of stagnation. In Turkey, we are more bullish on disinflation prospects than market pricing implies. We see 700bp of policy easing by end 2027. However, early 2028 elections will soon come into play.

Also covered in this publication, Croatia remains in good shape, politics remains challenging in Serbia, while Bulgaria is on the right path, albeit with imbalances. Ukraine continues to suffer from the destruction and macro imbalances of a protracted war. In the CIS, we see Uzbekistan as the outperformer given its strong and diversified growth, positive sovereign ratings momentum, and expected catch-up on gold exports.

In short, 2027 should be a year of idiosyncratic CEE stories. We are sure that the insights provided by our local economists and strategists make Directional Economics an essential guide to the region.

Chris Turner, Global Head of Markets and Regional Head of Research, UK & CEE

Country summaries: CEE4

Czech Republic

The global negative supply shock has propelled inflation upward and is now also taking its toll on economic activity, delivering a textbook outcome. Renewed growth in regulated and food prices is set to follow punchy fuel price gains, as Hormuz second-round effects start to materialise. Real GDP growth is set to slow to a mediocre pace, while the surge in inflation is set to cap real wage growth at the year turn. That said, manufacturing is proving resilient and will lend support to economic activity. Firms' profitability may erode due to rising input costs amid ample competition. The CNB is likely to opt for a tighter monetary policy, as the weaker koruna contributes to domestic price pressures via galloping import prices. Still, the currency is set to withstand potential bond market turmoil, as fragile French finances may cause the ECB to hesitate. The Czech fiscal position remains comparatively strong, despite some recent easing.

Hungary

Hungary has weathered the recent market storms uncharacteristically well. The antidote is called the "road to the euro". Policymakers have laid the foundations, and the project is entering its credibility-building phase. A credible medium-term fiscal plan, official talks on ERM II and progress towards the Maastricht criteria should put Hungary into a convergence corridor. At the end of that road, we see euro adoption in 2032 at the earliest. If all goes well, interest-rate convergence will follow, while keeping the forint stable remains a must. A 2-3% GDP growth and a 2-3% inflation environment in the years ahead provide solid macro foundations. Targeted measures will support consumption, EU funds and better sentiment will revive investment activity, while new export capacities strengthen external balances. Sovereign rating upgrades from 2027 would be the icing on the cake.

Poland

Poland is set to remain one of the fastest-growing EU economies in 2027, with public and private investment increasingly complementing consumption. Foreign investor exposure to equity and bonds reflects optimism on growth but concern on the fiscal side, with non-residents accounting for 80% of equity trading but only 12% of the POLGB stock. The government is pursuing a supply side agenda to support innovation in the economy, but further structural reforms are needed, particularly on fiscal policy, with a 2025-27 deficit of c.7% of GDP. We don't see fiscal adjustment in the 2027 election year but expect fewer and later NBP hikes (50bp in 1Q27 vs 100bp priced). In our view, elevated hike expectations overstate CPI risks as they also reflect a deterioration of the fiscal trajectory. Hike expectations may quickly compress, if energy prices reverse, but fiscal risks should stay elevated in the coming years as the combination of 2027 election uncertainty and a veto prone President creates risk of a downgrade (1-2 notches downgrade already priced) and is PLN negative.

Romania

Romania's macroeconomic adjustment is finally becoming visible, but progress remains vulnerable to political uncertainty. The budget deficit is narrowing and the country has retained its investment-grade rating. However, all three major rating agencies continue to rate Romania at the lowest investment grade with negative outlooks, leaving little room for policy missteps. The political stalemate risks overshadowing fiscal progress and keeping the sovereign risk premium elevated. With the economy quasi-stagnated for almost three years, further consolidation will be difficult. A broad political agreement on the 2027-28 fiscal framework would be the key positive catalyst, improving policy visibility, supporting the rating outlook and allowing fiscal adjustment to translate more clearly into lower funding costs and a gradual recovery in confidence.
At the time of writing (12 October), a new government is expected to be installed in the coming days, with a parliamentary confidence vote likely on 20 October.

Country summaries: Other Central & Eastern Europe

Bulgaria

Bulgaria enters the post-euro period with a stronger institutional and financial anchor, but also with a less comfortable macroeconomic mix. Domestic demand remains strong, supported by rapid wage growth, a tight labour market and robust public investments. At the same time, elevated inflation, accelerating credit and widening twin deficits expose the trade-offs from an increasingly procyclical policy stance. The alignment of bank reserve requirements with euro-area standards has also improved domestic funding conditions, supporting financial deepening but increasing the importance of macroprudential policy as credit growth and property prices accelerate. Low public debt remains an important buffer, but recurring expenditure commitments are gradually narrowing the margin for error.

Croatia

Croatia's economy continues to outperform the euro area, supported by resilient consumption, a tight labour market and the final phase of RRF-funded investment. However, growth has slowed more visibly in 2026, as sticky inflation, rising labour costs and weaker tourism have taken their toll on activity. Fiscal policy remains supportive, although strong nominal revenues should keep the deficit close to 3% of GDP and allow public debt to decline gradually. At the same time, a widening current-account deficit highlights the growing gap between still-solid domestic demand and the economy's external earning capacity. Political stability and a solid sovereign rating remain important buffers, while a key medium-term objective resides in the rotation of the RRF-driven investment and cohesion funding towards greater private investment.

Serbia

Serbia's economy has remained resilient despite elevated domestic and external uncertainty, supported by robust consumption, a strong labour market and continued investment ahead of EXPO 2027. The more supportive fiscal stance, including higher social spending, should sustain near-term demand but could add to both inflation and external pressures. The unresolved NIS ownership issue remains the main energy risk, as the US Treasury's extension lasts only until 30 October. Meanwhile, the 25 October parliamentary election and Aleksandar Vučić's pursuit of the premiership add to the near-term political uncertainty, while Serbia's long-term balancing of relations with the EU, Russia and China has become increasingly difficult against the current geopolitical backdrop.

Turkey

The Middle East remains focused on the US-Iran standoff with pressure on energy prices creating challenges for net energy-importing economies, such as Turkey. Domestically, the closure of certain investment funds prompted some investors to unwind money market fund positions, although dollarization pressures remained contained. CBT reserves declined in September amid weaker confidence, while maintaining strong reserve buffers remains important for absorbing potential shocks and preserving the exchange rate as a key policy anchor. Slower economic activity, softer domestic demand, low core goods inflation and easing services inflation have reduced upside inflation risks, leading the CBT to lower the effective funding cost. Markets continue to expect further rate cuts this year, although reserve volatility and investor confidence remain important considerations for the CBT.

Country summaries: CIS

Armenia

Armenia has shown remarkable resilience to the global and regional challenges of 2026, supported by renewed inflows of visitors, remittances and capital. Skilful foreign policy manoeuvring and solid finances provide additional support to sentiment and insulation to the balance of payments. However, the increasing reliance on external inflows is a watch factor, as persistent twin deficits and close economic links with Russia remain important vulnerabilities. Higher CPI risks stemming from domestic demand and external cost inputs have prompted the region's first rate hike this year, with further upside risks in sight. While we remain constructive on Armenia's macro outlook and assets, we see growing exposure to foreign politics-related downside risks, while the AMD appears increasingly expensive relative to fundamentals.

Azerbaijan

Azerbaijan remains the CCA region's financially strongest sovereign, supported by large and growing fiscal and monetary reserve assets, low public debt and a robust external balance sheet. Higher hydrocarbon prices have strengthened the near-term fiscal and external outlook, as well as domestic confidence in the non-oil sectors. However, weak oil production, limited diversification and subdued private investment continue to constrain potential growth. Inflation is manageable for now, supporting an extended policy hold, although imported price pressures through high exposure to trading partners with high risks of upward CPI surprises, warrant caution. We remain constructive on sovereign resilience and external stability but see structurally modest growth as the main medium-term challenge.

Kazakhstan

Kazakhstan continues to benefit from one of the strongest sovereign and external positions in the CCA region, supported by sizeable sovereign assets, a balanced network of international partners and higher oil prices. More recently, strong portfolio inflows given still-attractive real rates, progress towards Euroclear connectivity, growing domestic debt supply and positive rating momentum have supported the tenge and local markets. In addition, a sizeable backlog of future state FX sales provides an important buffer against potential market stress. At the same time, the longer-term outlook remains constrained by persistent twin deficits, limited private-sector investment and capital inflows and an uneven track record in fiscal discipline and inflation targeting. Current CPI trend leaves room for a moderate easing, but the trajectory is facing upside risks.

Ukraine

The hryvnia remained under pressure as the dollar strengthened, partly due to renewed Middle East tensions. Consequently, USD/UAH temporarily broke above 45.0, reaching its highest level on record. Hryvnia depreciation could have been sharper, but NBU actions provided support. In September, the central bank raised rates by 50bp to 16.0% and maintained sizeable FX interventions, with the four-week average close to record highs, which demonstrates the NBU's determination to stabilise the exchange rate. FX reserves remain volatile but new tranches of foreign loans should lift them to around US$60bn. The macroeconomic environment remains challenging due to the ongoing war with Russia, despite intensified rhetoric and pressure from the US administration.

Uzbekistan

Uzbekistan remains our preferred story in the CCA region, combining strong and diversified growth, continued reforms and positive sovereign-credit momentum. An expected catch-up in gold exports, alongside ongoing capital inflows linked to the privatisation pipeline (UzNIF+12 SOEs) is supporting a positive performance from the soum. Combined with fiscal consolidation, this has helped bring the inflation rate down since the start of the year, improving the scope for further monetary easing. At the same time, longer-term vulnerabilities stem from persisting twin deficits, continued high state involvement in the economy and a long history of above-target inflation. A more meaningful monetary easing and a lasting break from UZS's depreciation trend would require a further decline in inflation and more durable private capital inflows.

ING EM FX and local rates views summary

Country	Foreign exchange	Local debt and rates
Czech Republic	EUR/CZK has remained stable since the onset of the US-Iran conflict and, looking ahead, the koruna should be supported by a hawkish tone from the CNB. An additional rate hike in November, along with the risk of further hikes and rising inflation through to the end of the year, should push the pair back towards 24.00, with the koruna to outperform its CEE peers.	The hawkish CNB, combined with significant inflation exposure to energy and food prices, should sustain aggressive market pricing, even in the event of a global relief, given the prevailing inflationary environment. Likely exclusion from the GBI-EM index (a benchmark for local-currency emerging-market government bonds) supports a bearish outlook for CZGBs.
Hungary	The Hungarian story following the general election in April is unfolding according to plan; persistently high interest rates and the market expectation that the NBH will not cut rates should keep the forint supported. While global factors and heavy long positioning run counter to bullish sentiment, we still expect the EUR/HUF pair to grind lower from here.	Bonds and rates have seen a significant rally and country premium compression since the general election, and we remain bullish on the local story. However, Hungary was our best trade this year; given tight valuations and crowded positioning, we are waiting for better levels and looking to fade sell-offs given that compression is ahead of the usual schedule of euro adoption.
Poland	Poland remains exposed to the global market, not only due to energy prices but also because of a record-high fiscal deficit. The central bank is moving closer to rate hikes, yet it leans towards the dovish side with the widest gap between market expectations and our own forecast for the key policy rate path. This combination should push the EUR/PLN pair higher.	A record-high public finance deficit, rising inflation and the risk of further rating downgrades could generate significant selling pressure for POLGBs. The central bank is likely to continue delaying rate hikes. We expect the first rate hike in 1Q27, with rate hikes still priced in for this year.
Romania	EUR/RON has experienced increased volatility in recent weeks, but the outlook regarding the new government should help stabilise the pair. On the other hand, we see no room for a downside. The risk remains tilted to the upside should political uncertainty return, the government disappoint the market regarding fiscal consolidation or the rating get downgraded.	ROMGBs have seen a significant tightening of spreads relative to CEE peers and valuations appear expensive. The issuance and fiscal outlook remain uncertain, while the credit rating outlook clouds the future. A rebound in inflation complicates the outlook for NBR rate cuts.
Ukraine	The hryvnia remained under pressure as the dollar strengthened, partly due to renewed Middle East tensions. Consequently, USD/UAH temporarily broke above 45.0, reaching its highest level on record. The NBU raised rates by 50bp to 16.0% and maintained sizeable FX interventions, which demonstrates the NBU's determination to stabilise the FX.	Substantial external financial assistance in the form of foreign loans from international partners has translated into fast rising public and external debt levels, both of which exceeded 100% of GDP in 2025, and are set to rise further in the coming years. Both fiscal and external current account gaps, as well as public and external debt levels, are set to widen significantly.
Kazakhstan	The easing in inflation and a resilient tenge have allowed the NBK to start cutting the base rate in 2026. Higher oil prices have strengthened the external position. We see an improved KZT outlook but note that greater reliance on portfolio capital in an economy with persistent twin deficits also increases sensitivity to shifts in global risk appetite and flow reversals.	
Turkey	The CBT is leaving less carry on the table for TRY longs, yet we also see the central bank's commitment to maintaining the current FX regime for longer. FX reserves remain near highs and the recent funds crisis has once again demonstrated the stability of the FX rate during periods of stress.	In line with our expectations, the market is pricing in 200bp of rate cuts from the CBT; however, for next year, it anticipates rates to remain roughly stable, whereas our forecast points to further cuts. The curve should see more steepening, given underpriced CBT expectations, and duration buyers would need to see greater global relief before returning to the market, which is not on horizon.

Central Europe's next growth engine: From FDI hosts to global investors

Michał Rubaszek
Senior Economist, Poland
michal.rubaszek@ing.pl

Introduction

Central and Eastern Europe (CEE) has been remarkably successful in attracting foreign companies. The next challenge is to build more multinationals of its own. For three decades, inward foreign direct investment (FDI) and exports have powered the region's integration with Western Europe, bringing technology and know-how, which supported rapid income convergence (see 2024 Directional: *Why beating the middle-income trap isn't enough*). But as labour-cost advantages gradually diminish (see 2025 Directional: *From working hard to working smart*), the old growth model will become harder to sustain. The next stage of convergence will increasingly require successful domestic firms to scale internationally.

Outward direct investment (ODI) can become an important new engine of CEE growth. Investing abroad gives firms access to new customers, technologies, brands and capabilities. It allows successful companies to overcome the limitations of relatively small domestic markets, achieve greater scale and strengthen their ability to innovate. Profits generated abroad can also become an additional source of national income.

CEE has already started this transition, but the region still punches below its weight as a foreign investor. Czechia has progressed furthest, while ODI in Poland and Romania remains low relative to their level of economic development. This does not appear to reflect a shortage of firms capable of competing internationally: the region has created a growing group of successful companies with the capital, technology and managerial capabilities required to expand abroad. What many still lack is sufficient scale, experience and an institutional environment that makes foreign investment easier.

Economic policy needs to adjust to support ODI. For decades, CEE governments have concentrated on attracting foreign investors and helping domestic companies export. This is gradually changing, but support for outward investment remains less developed. Governments do not need to pick national champions or subsidise capital leaving the country. Their role should be to remove unnecessary barriers by providing market intelligence, financing and risk-sharing instruments, regulatory support and effective economic diplomacy.

Ultimately, firms rather than governments will drive the transition. Entrepreneurs and managers must identify viable opportunities, build international capabilities and accept the risks associated with expansion abroad. Public institutions can make that process easier, but they cannot substitute for business decisions. CEE's next development challenge is therefore clear: to remain an attractive home for global companies while creating the conditions for more of its own firms to become global.

1 Investment Development Path framework

The Investment Development Path (IDP) framework implies CEE should invest abroad. The IDP, formulated by Dunning,[1] links a country's ODI and FDI stocks to its stage of development. The central idea of the IDP is that as countries become wealthier and more competitive, they evolve from being primarily hosts for foreign investment to becoming significant outward investors. As discussed in a recent survey of Sawitri and

[1] Dunning J., 1981. Explaining the international direct investment position of countries: Towards a dynamic or developmental approach Weltwirtschaftliches Archiv 117, 30–64.

Brennan,[2] the IDP framework is the most frequently employed empirical assessment reflecting a country's direct investment activities in relation to the level of economic development.

The IDP model identifies five stages of economic development:

Stage I. A low-income country with insignificant levels of both FDI and ODI.

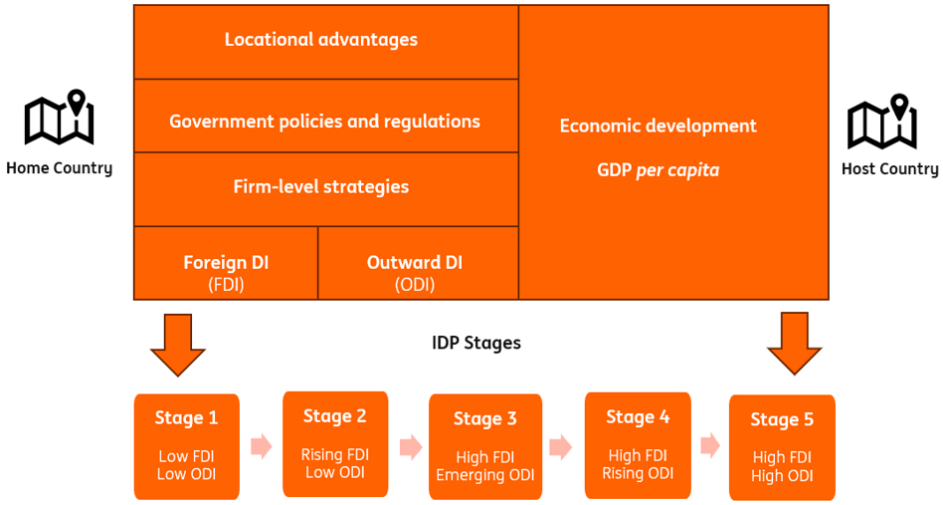
Stage II. A developing country that becomes an attractive localization for multinationals. Active government policies promote FDI, which stock increases to significant levels. ODI remains low and the net position is deteriorating.

Stage III. A middle income country, in which firms have already accumulated technological and managerial capabilities. The government actively promote FDI and exports, with little focus on ODI. FDI stabilizes at high levels and ODI starts to emerge.

Stage IV. A high-middle income country with emerging mass of competitive domestic firms that become multinationals, which is supported by the government. FDI stabilizes and ODI grows so that net position is improving.

Stage V. A developed economy with extensive multinational activity. The government plays a less significant role in attracting FDI or stimulating ODI. The levels of FDI and ODI stocks are stable at high levels with balanced or positive net position.

Fig 1 IDP framework for the link between FDI/ODI stocks and economic development



Source: ING based on Sawitri and Brennan (2023)

The IDP model is a suitable framework for aggregate analysis as it perceives FDI and ODI as both a consequence and a driver of economic growth. Inward foreign investments enhance productivity, technology transfer, and competitiveness, while outward investments reflect the emergence of productive domestic firms capable of exploiting their advantages internationally. The exact trajectory varies across countries depending on their institutions, policies, industrial structure, and integration into the global economy. The extensions of the IDP framework emphasize these country-specific factors and the increasing complexity of multinational enterprise strategies in a globalized economy (see Fig 1).

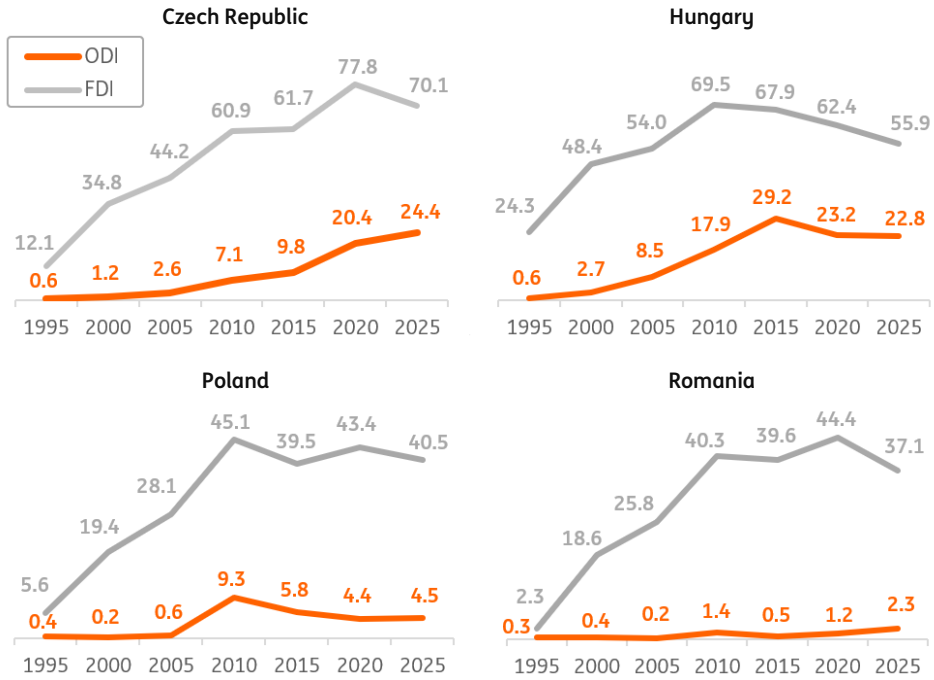
2 Progress of CEE within Investment Development Path

The evolution of FDI and ODI in CEE conforms to the predictions of the IDP framework. Fig 2 illustrates that in the mid-1990s CEE economies (Czechia, Hungary, Poland, Romania) were in Stage I of the IDP, as the stocks of both FDI and ODI were relatively

[2] Sawitri, K., Brennan, L., 2023. The investment development path literature: a review and research agenda. Management Review Quarterly 73: 1825–1872.

insignificant. Between 1995 and 2010, they progressed towards Stage II as the substantial inflow of FDI was accompanied by limited ODI. During this period, FDI inflows were supported by active government policies, including tax incentives and subsidies, combined with the stability and credibility provided by the EU accession process. By 2010, the stock of inward FDI ranged from around 40% of GDP in Romania to nearly 70% of GDP in Hungary, whereas ODI stocks remained much lower. Subsequently, in years 2010-2025, CEE4 progressed towards Stage III of the IDP: FDI stocks stabilized at relatively high levels, while ODI began to emerge. At present, one can observe the increasing number of internationally active domestic firms, which signals a transition towards Stage IV of the IDP.

Fig 2 The evolution of FDI and ODI in years 1995-2025 (stocks, as % GDP)

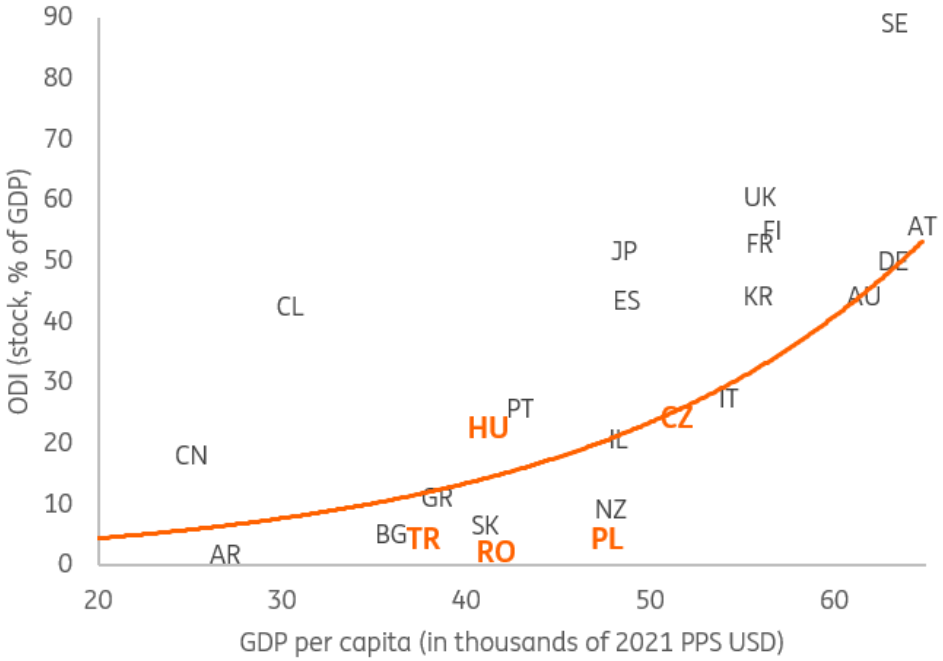


Source: UNCTAD World Investment Report, IMF WEO, ING calculations

CEE4 are heterogeneous in their progress along the IDP. Fig 2 indicates that Czechia and Hungary have succeeded in attracting large FDI stocks, well in excess of 50% of GDP, while simultaneously expanding ODI stocks to levels above 20% of GDP. It must be noted, however, that about three quarters of Hungarian ODI stock are related to special purpose entities (SPEs), which substantially distort the picture of cross-border investment. If SPEs are not accounted for, the level of Hungarian ODI falls to about 5% of GDP.[3] Poland and Romania, the two largest CEE4 countries, recorded FDI stocks fluctuating around 40% of GDP and ODI remaining below 5% of GDP. Overall, while all CEE4 economies have successfully attracted FDI, only Czechia has made significant progress towards Stage IV of the IDP. Low levels of ODI in Hungary, Poland and Romania indicates that the internationalization of domestic firms remains an important challenge.

[3] SPEs are legal entities with little or no production or operations typically established to channel funds within multinational groups (see Eurostat).

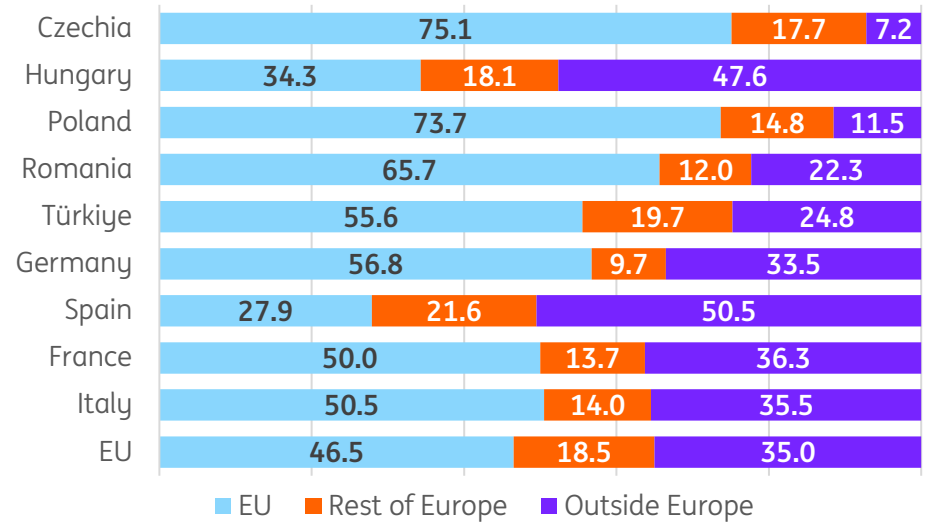
Fig 3 ODI stock and the level of economic development in 2025



Source: UNCTAD World Investment Report, IMF WEO, ING calculations

ODI levels in CEE remain below those implied by their level of economic development. We illustrate this in Fig 3, which presents the relationship between the stock of ODI as a share of GDP and GDP per capita for a sample of global economies. The fitted trend curve suggests that at GDP *per capita* levels of 40,000–50,000 PPS, ODI stocks would typically amount to around 20% of GDP. The positions of Poland and Romania indicate that their ODI stocks remain low relative to what might be expected given their level of economic development. By contrast, ODI in Czechia is close to the fitted trend, while Hungary lies above it, although this result is largely driven by the activity of SPEs. A comparison with Portugal and Spain, two EU countries with broadly comparable levels of GDP per capita, further highlights this gap, as both display substantially higher ODI stocks than the CEE economies. Figure 3 also suggests that, as income convergence continues, ODI stocks in the CEE should increase towards the levels observed in more advanced economies, where they typically range between 30% and 60% of GDP.

Fig 4 Geographical decomposition of ODI stock (2024, % of total stock)



Source: UNCTAD World Investment Report, IMF WEO, ING calculations

CEE outward investments remain strongly concentrated in Europe. Investing abroad is challenging for CEE companies due to numerous factors, including insufficient access to capital, limited public support, and relatively little experience in establishing and managing foreign affiliates compared with Western European firms. CEE firms are also at a disadvantage relative to companies from selected Western European countries that can profit long-standing linguistic, cultural and institutional ties with geographically distant markets. Spain and Portugal provide particularly relevant examples, as their historical links and shared languages with Latin America have facilitated ODI in this region. These differences are reflected in the geographical structure of ODI. Fig 4 illustrates that most investment from the CEE is located in Europe, often in neighbouring countries, where geographical and cultural proximity, established trade relationships and familiarity with local business conditions reduce the costs and risks of establishing foreign affiliates. In 2024, the share of investment outside Europe in total ODI amounted to merely 7.2% in Czechia, 11.5% in Poland, 22.3% in Romania and 47.6% in Hungary. However, once special purpose entities (SPEs) are excluded, the corresponding share for Hungary declines to 11.6%. These figures are substantially below the 35.0% share of extra-European investment in total ODI originating from EU countries.

3 Moving towards stage IV of IDP should boost growth

Moving towards Stage IV of the IDP constitutes an upgrade of the CEE growth model. Progress towards Stage IV does not mean abandoning the successful model from the past, but complementing it with a stronger domestic multinational sector. Instead of relying predominantly on foreign firms to bring technology, capital and know-how, an increasing number of CEE firms could themselves exploit their competitive advantages abroad. Rising ODI should be viewed not simply as capital leaving the domestic economy, but as evidence that domestic firms have accumulated sufficient capabilities to compete, invest and generate income internationally.

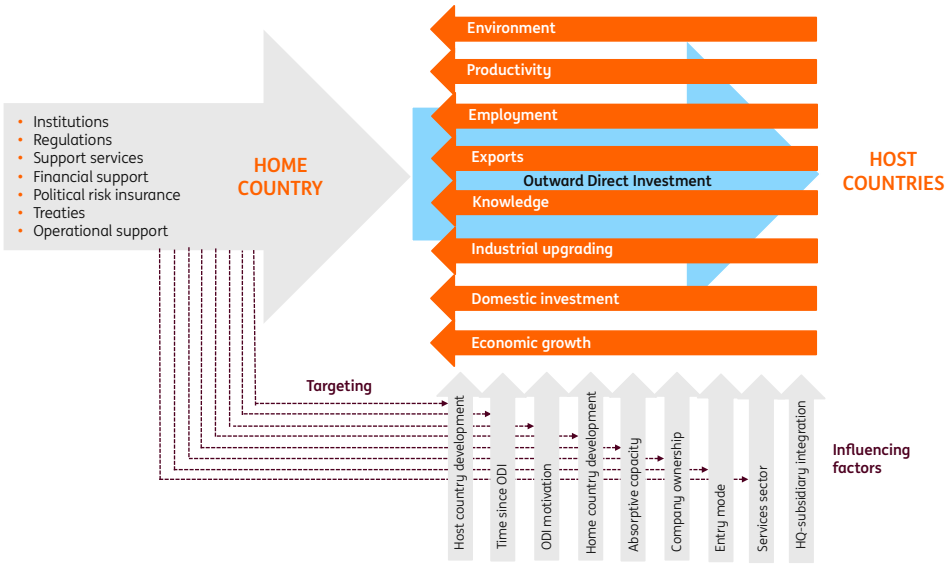
The economic benefits of this transition could be substantial for firms. Domestic markets, even in Poland and Romania, are relatively small compared with the global market, placing limits on the scale that successful firms can achieve domestically. As enumerated by Gorynia et al.,[4] expanding abroad allows firms to enlarge their customer base, spread fixed costs over greater sales, improve asset utilisation and increase the returns to expenditure on innovation, automation, digitalisation and brand development. Foreign investment can therefore help successful CEE firms move from competing predominantly on costs towards competing increasingly on scale, technology, brands and other firm-specific advantages. In other words, at the firm level, ODI should support the transition towards productivity and innovation driven expansion model.

ODI brings benefits to the home economy through several channels. Foreign affiliates provide access to new customers, hence can strengthen exports by creating distribution networks and generating demand for intermediate goods and services supplied by the parent company and its domestic suppliers. Foreign acquisitions may provide access to technologies, brands, managerial expertise and other strategic assets that can subsequently be transferred across the multinational group. Greater international scale can also strengthen firms' incentives to invest at home in research and development. Finally, profits earned abroad add to national income and diversify corporate earnings away from domestic economic conditions. These channels are particularly relevant for the relatively small and open CEE economies.

[4] Gorynia, M., Nowak, J., Wolniak, R., Trąpczyński, P. (2022). How does economic integration affect progress along the investment development path? A case study of EU member vs. non-member countries from Eastern Europe. Journal of Modern Science, 49(2), 177-214.

Increasing ODI should not be interpreted as an objective for its own sake. Not all ODI benefits the home economy. ODI may involve the relocation of production, employment or investment abroad, particularly when firms invest primarily to lower production costs. It may therefore substitute for domestic capital formation or adversely affect some domestic suppliers and workers. Foreign operations also expose companies to additional commercial, regulatory, political and exchange-rate risks. The balance of these effects depends on the motivation and type of investment and, in particular, on whether foreign operations complement or substitute for domestic activities.

Fig 5 Channels of transmission from ODI to home economy



Source: ING based on Knoerich and Benson (2026)

Empirical evidence is clear that ODI is beneficial for home countries. The recent survey of 130 academic studies by Knoerich and Benson[5] reveals that most studies report positive effects of ODI for aggregate economic activity, where the effects operate through numerous channels of transmission (see Fig 5). They indicate that by expanding internationally, firms can reach larger markets, acquire technologies and other strategic assets, and improve their competitiveness, with part of these benefits subsequently transmitted back to the home economy. The evidence also suggests that the benefits tend to be stronger when firms invest in advanced economies, seek strategic assets such as technology, and possess sufficient capacity to absorb knowledge acquired abroad. **For CEE economies, at their current stage of development, potential benefits of ODI are likely to outweigh their costs.**

4 Conditions of moving towards Stage IV of IDP

There are two determinants of firm's decision about foreign investment: productivity and fixed costs of investing abroad. This is the key implication of the Helpman-Melitz-Yeaple (HMY) model,[6] in which less productive firms serve only the domestic market, more productive firms become exporters, and the most productive firms undertake direct investment abroad. The productivity thresholds are determined by fixed costs of going global. The model clearly implies that, **once a sufficient number of highly productive firms emerges, policies aimed at reducing the fixed costs of foreign expansion should increase the scale of ODI**. This insight is particularly relevant for CEE economies. The region's most competitive firms appear increasingly to possess the technological capabilities, managerial expertise, financial resources, and international

[5] Knoerich J., Benson D. (2026) Home-country effects of outward foreign direct investment: A systematic review of empirical and policy evidence. International Business Review, 35(1), 102529.
[6] Helpman E., M. Melitz, and S. Yeaple. 2004. Export Versus FDI with Heterogeneous Firms. American Economic Review 94 (1): 300–316.

market knowledge required to undertake profitable investments abroad. Consequently, policies designed to lower barriers of entering foreign markets could play an important role in accelerating the transition of CEE economies towards the stage IV of the IDP.

HMY model is strongly supported by firm-level data: internationally active companies are substantially larger and more productive than firms operating exclusively in domestic markets. At the EU level, the average employment in domestic firms is 4.2 employees, compared with 72.0 in foreign-owned firms and 125.9 in foreign affiliates of domestic companies. Similarly, average turnover per employee amounts to €199 thousand in domestic firms, compared with €444 thousand in foreign-owned firms and €406 thousand in foreign affiliates. These numbers illustrate the strong association between internationalisation, scale and productivity. Expanding the group of CEE firms capable of operating across borders could therefore contribute to aggregate productivity growth by allowing the region's most competitive companies to reach a considerably greater scale.

Fig 6 Characteristics of domestic and international companies

	Czechia	Hungary	Poland	Romania	EU
Domestic companies					
Average employment	2.4	2.9	3.4	3.6	4.2
Net turnover per employed	144	98	141	79	199
Foreign owned companies (FDI)					
Average employment	43.7	49.6	337.4	42.4	72.0
Net turnover per employed	318	293	249	192	444
Foreign affiliates of domestic companies (ODI)					
Average employment	83.5	197.9	61.5	69.5	125.9
Net turnover per employed	415	470	421	142	406

The example of Asian Tigers proves that limiting fixed entry costs boosts ODI, which is the key mechanism emphasized by the HMY model . The main logic of ODI policies in Asian Tigers is that domestic firms must expand abroad to overcome the limitations of domestic market, which can be facilitated by reducing informational and organizational barriers associated with establishing foreign affiliates. In Singapore, a dedicated entity EnterpriseSG has been established to help companies in scaling up by going global through exports and ODI. EnterpriseSG supervise 35 centers in over 20 countries, each providing market research, database of foreign partners, and legal assistance to Singaporean companies in establishing foreign subsidiaries. EnterpriseSG also offers financing schemes that support firms' internationalization through ODI. In South Korea, ODI expansion has been also been facilitated by a dedicated agency: the Korea Trade-Investment Promotion Agency (KOTRA). It now operates 131 offices in 86 countries to assist Korean firms entering foreign markets by providing market intelligence, business networks, diplomatic and legal support. The policy focus is less on subsidizing ODI directly but on alleviating information and coordination failures associated with internationalization. The Asian Tigers experience also implies that governments are effective when they focus on lowering the fixed costs of foreign market entry, rather than attempting to directly determine which firms and where should invest.

5 ODI promotion by CEE institutions

ODI promotion in CEE countries remains relatively underdeveloped and is usually embedded within broader strategies for promoting exports and attracting FDI. This largely reflects the historical focus of CEE countries on attracting inward FDI and supporting exports rather than explicitly encouraging outward investment. However, there are signs that this model of internationalisation is gradually evolving towards a broader approach that increasingly recognizes ODI as an additional channel for the

international expansion of domestic firms. This shift can build on existing institutions, which already support firms operating abroad by providing market intelligence, financing, risk mitigation, and general advisory services.

In Poland, the institutional framework for internationalisation has traditionally focused predominantly on export promotion and attracting inward FDI, although it is gradually evolving towards broader support for the foreign expansion of Polish firms. The Polish Investment and Trade Agency (PAIH) is the main agency responsible for internationalization of the economy, as it maintains a global network of nearly 60 Foreign Trade Offices, covering more than 70 foreign markets. Historically, PAIH has been strongly oriented towards supporting exporters and attracting foreign investors to Poland, and these objectives remain prominent in its 2025–2029 strategy. However, the new strategy also envisages supporting foreign expansion of Polish firms by providing market intelligence and advisory support. A more explicit focus on ODI is presented in the Polish Development Fund (PFR) strategy for 2026–2030, in which it identifies the internationalisation of Polish firms as one of its strategic priorities, covering both exports and ODI. PFR's strategy explicitly envisages investment in the international expansion of Polish companies. In 2015 PFR launched the first edition of Foreign Expansion Fund (FEF), which in the period 2015-2023 co-financed about 20 ODI projects with the total sum of €100 million. The second edition of FEF, which was initiated in 2023, aims to co-invests with Polish firms in foreign affiliates by providing co-financing for acquisitions, greenfield investments, and the expansion of existing foreign operations. The engagements is not large and range from EUR 3 million to EUR 20 million and may cover up to 50% of total project value. Finally, KUKE complements these instruments by providing insurance and risk-mitigation instruments for Polish firms investing abroad. Taken together, these developments indicate a gradual shift from a framework centred on exports and FDI towards a broader internationalisation strategy that increasingly recognizes ODI. Nevertheless, dedicated support for ODI remains relatively modest compared with the scale of instruments available for exporters and inward investors.

In Czechia ODI promotion is a side effect of exports promotion. CzechTrade is the main agency supporting Czech firms expansion abroad. The agency maintains a network of foreign offices in more than 50 countries, providing local market intelligence and facilitating contacts with potential business partners. The Czech model remains strongly export-oriented, but many of the services offered by CzechTrade, especially partner searches, market studies, and foreign offices, can also support ODI decisions. Czech firms contemplating acquisitions or greenfield investments abroad often rely on the same informational infrastructure initially developed for exporters. Overall, Czech policy focuses primarily on export support rather than dedicated ODI promotion, but provides a substantial institutional platform lowering the information costs of foreign expansion.

In Hungary ODI support is linked to National Export Strategy. The Hungarian Export Promotion Agency (HEPA), which operates under the supervision of the Ministry of Foreign Affairs and Trade, is responsible for promoting the international expansion of Hungarian enterprises through exports, but also investments abroad. HEPA reduces the fixed costs of foreign-market entry by providing market intelligence and advisory services, i.a. by collaborating with network of foreign economic attachés and overseas offices. International expansion is also supported by EXIM Hungary, whose programs include preferential financing, insurance and guarantee products for foreign expansion. However, the system remains predominantly export-oriented rather than explicitly focused on supporting ODI.

Romania also remains focused on exports and attracting inward FDI. The Romanian Agency for Investments and Foreign Trade (ARICE) is the key responsible for supporting the internationalization of domestic firms. Its instruments include the Export Promotion

Programme, international trade fairs and economic missions, business matchmaking, and information on investment opportunities abroad. The support remains predominantly oriented towards exports and initial foreign-market entry, while dedicated instruments addressing the financing and risk-sharing needs of firms undertaking ODI appear underdeveloped.

Overall, CEE countries have developed institutions supporting the internationalization of domestic firms, but these institutions remain primarily oriented towards export promotion rather than ODI. Poland's PAIH, Czechia's CzechTrade, Hungary's HEPA, and Romania's ARICE all provide market intelligence, business matchmaking, and foreign-office networks that reduce the fixed costs of entering foreign markets. However, dedicated financial instruments supporting ODI remain limited. **In our view, current internationalization policies in CEE insufficiently recognize the benefits of ODI.**

6 CEE firms already go multinational

CEE firms are steadily expanding their presence abroad, suggesting that they have developed the capabilities required for ODI. CEE firms have already accumulated capital, technology, managerial expertise and knowledge of foreign markets so that the most productive firms increasingly progress beyond exports towards a permanent presence abroad through acquisitions, greenfield investment and launching foreign subsidiaries. This evolution is visible in the growing number and scale of foreign affiliates controlled by CEE companies. Fig 7 displays that between 2016 and 2023, the number of foreign affiliates owned by CEE4 firms increased by 34% (from 2,746 to 3,670). This growth was particularly strong in Czechia (from 233 to 807) and Romania (from 101 to 210), and somewhat less pronounced in Poland (from 2,151 to 2,325) and Hungary (from 261 to 328). The expansion of foreign affiliates has been accompanied by an even stronger increase in their employment. Between 2016 and 2023, employment in foreign affiliates controlled by CEE4 firms rose from 182 thousand to 290 thousand, i.e. by 60%. This points to foreign expansion along both the extensive margin, through a larger network of affiliates, and the intensive margin, through the expansion foreign affiliate size.

Fig 7 The number of foreign affiliates

	Enterprises number			Employment (1,000 persons)		
	2016	2020	2023	2016	2020	2023
Czechia	233	573	807	30.4	37.7	67.4
Hungary	261	365	328	40.0	46.9	64.9
Poland	2,151	1,897	2,325	107.7	127.4	143.0
Romania	101	115	210	4.3	7.7	14.6
CEE4	2,746	2,950	3,670	182.4	219.7	289.9

Source: ING calculations using Eurostat data (fats_out_activ)

CEE firms broadened their international presence, but did not achieve a truly global scale. Several ODI from CEE countries are well known to the public, including ODI by energy sector companies (ORLEN from Poland, ČEZ from Czechia, MOL Group from Hungary), financial institutions (PPF Group from Czechia, OTP Bank from Hungary), goods producers (LPP and Maspex from Poland, CSG from Czechia, Richter from Hungary) or service providers (Asseco and inPost from Poland, 4iG from Hungary, DIGI Communications from Romania). Nevertheless, even the largest CEE-based multinationals remain relatively small by global standards. No CEE company appears among the world's 100 largest non-financial multinational enterprises in UNCTAD's World Investment Report 2025. The company ranked 100th reported foreign assets of around $54 billion, much above the biggest ODI investment.[7] This suggests that future

[7] Foreign assets of the top investor on the list of largest private Polish investors in 2024 presented by Forbes, LPP, amounted to PLN14.7 billion (US$3.6 billion).

ODI growth in CEE may come not only from more firms investing abroad, but also from scaling-up of existing foreign investment by current CEE multinationals.

Evidence from Poland suggests that firms increasingly perceive international expansion as a prerequisite for further growth. In our report prepared for the European Economic Congress in Katowice, in-depth interviews with 30 Polish business leaders indicates that Polish companies increasingly view international expansion not as an option, but as a strategic necessity. The main insights from the report can be summarized as follows:

1) Internationalisation is a prerequisite for sustained growth as domestic market can no longer provide the scale needed to justify major investment in automation, digitalisation and advanced production. ***"Foreign expansion is now a necessity, not an option."*** (Grzegorz Rychwalski, Vice-President, Polish Association of Employers of the Pharmaceutical Industry).

2) Acquiring foreign businesses provides customers, brands and local capabilities. Partnerships with global companies offer a bridge for firms without recognised international brands. ***"I already see greater scope, for example, for acquisitions of German companies."*** (Dariusz Grzeszczak, President, Erbud).

3) Scale is the missing link: preferential SME treatment may create a growth trap. Support should reward productivity and provide instruments for mature companies undertaking strategic cross-border projects. ***"The greatest impact comes from entities that operate on a global scale."*** (Janusz Zakręcki, President, PZL Mielec).

4) Economic diplomacy should be coordinated: domestic development institutions are helpful, but the support landscape remains fragmented and complex. Mature firms pursuing major contracts or acquisitions need a single rapid route to finance, insurance and diplomatic support that bring domestic supply chains into overseas infrastructure and strategic projects. ***"The most effective model of expansion is to operate as a general contractor."*** (Piotr Kańtoch, Vice-President, Grupa Powen-Wafapomp).

5) **Conservative financing limits the pace of expansion.** Reliance on retained earnings and public grants or preferential financing from the EU strengthens resilience but can slow investment, acquisitions and international scaling. Companies need broader use of risk capital, long-term debt, export credit and transaction insurance, supported by stronger financial capabilities. Public instruments should crowd in commercial finance rather than replace it where market funding is available.

Takeaways

The main takeway of our analysis is that ODI could become an increasingly important engine of CEE growth. Over the past three decades, inward FDI and exports have been powerful engines of convergence, but the next stage will increasingly require successful domestic firms to scale internationally. In CEE countries ODI remains low relative to the level of economic development, despite a growing number of firms with the capabilities to operate abroad. Moving towards Stage IV of the IDP would therefore represent a natural evolution of the CEE growth model, complementing the benefits of inward FDI with those generated by domestic multinationals.

For policymakers, the key takeaway is that ODI can be supported by reducing fixed costs of entering foreign markets. CEE countries do not need to subsidise capital outflows or select national champions. Instead, successful policy would reduce the fixed costs and risks that discourage competitive firms from investing abroad. Existing export-promotion infrastructure provides a strong starting point, but support could be increasingly extended beyond exports to acquisitions, greenfield projects and foreign

subsidiaries. This requires efficient market intelligence, partner identification, financing and risk-sharing instruments, legal and regulatory assistance, and coordinated economic diplomacy. The gradual shift already visible in Poland indicates that the region's institutional architecture is beginning to move in this direction.

For firms, the key takeaway is that going global can provide an important avenue for further growth. The most productive CEE firms can benefit from international expansion through access to new customers, technologies, brands and know-how, as well as greater economies of scale. Successful expansion, however, requires a more international management mindset, careful identification of commercially viable opportunities, and an appropriate financing strategy.

Ultimately, the transition towards a more internationally oriented CEE growth model will have to be driven by firms themselves. Governments can create favourable conditions for outward expansion, but they cannot determine which firms should invest abroad or where the best opportunities lie. These decisions must remain with entrepreneurs, managers and investors responding to market incentives. As CEE economies mature and domestic firms accumulate competitive advantages, international expansion is likely to become an increasingly natural route to greater scale, productivity and innovation. **The next stage of CEE convergence will therefore depend not only on the region's continued ability to attract foreign multinationals, but increasingly on its ability to develop successful multinationals of its own.**

EMEA FX, rates and debt strategy

Frantisek Taborsky
EMEA FX & FI Strategist
frantisek.taborsky@ing.com

EMEA economies have weathered the US-Iran supply shock better than expected, with the CEE3 growth forecast at 2.8% this year and 3.0% next year. Consumption remains the main driver, although slowing real wage growth and higher inflation will increasingly constrain households. Food and household energy costs are set to lift CEE3 headline and core inflation next year, while Romania and Turkey should continue to disinflate from high levels. Monetary policy will diverge: the CNB is expected to hike again in November, the NBP to start tightening in early 2027, while the NBH, NBR and CBT retain scope to cut. The global backdrop remains hostile for EMEA assets, reflecting a strong US dollar, high energy prices, geopolitical uncertainty and further Fed and ECB tightening.

Macro outlook: Growth holds, price pressures build

EMEA economies have remained resilient to the supply shock triggered by the US-Iran conflict in March. Although activity has slowed, the downturn has been much milder than initially expected given the region's heavy dependence on energy and imports. Our economists forecast GDP-weighted CEE3 growth of 2.8% this year and 3.0% next year, led by household consumption, while industrial sentiment remains broadly stable. Hungary has caught up with Poland and the Czech Republic despite global headwinds, but domestic pressures and fiscal consolidation continue to weigh on Romania, where we expect a mild 0.5% recession this year followed by 2.2% growth next year. Turkey is also losing momentum, particularly in domestic demand, although exports should support growth of 2.8% this year before an acceleration to 4.5% next year. PMI data indicates the region's resilience; with the exception of Turkey readings have improved from their pre-conflict February levels in all countries, pointing to continued strength in the months ahead.

Fig 8 PMIs indicate continued economic resilience

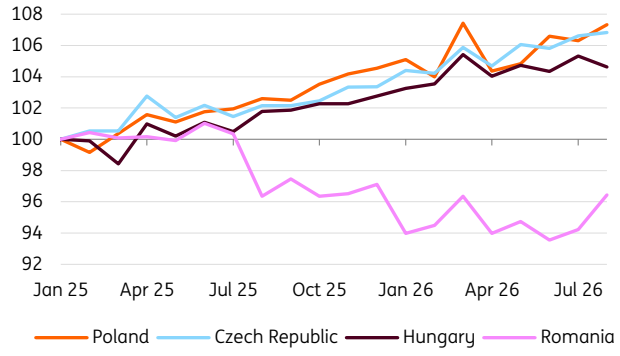
Fig 9 Retail sales (January 2025 = 100)



Source: Macrobond, ING

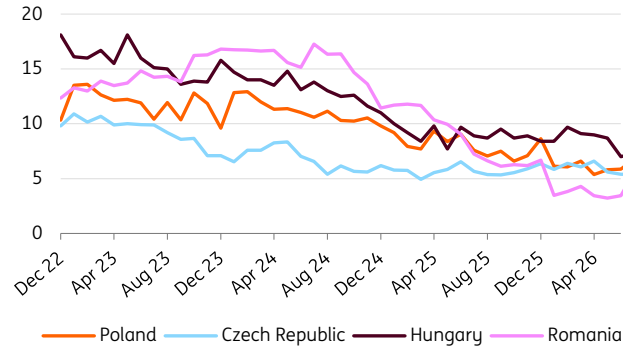
EMEA labour markets have eased over the past year, slowing wage growth. Real wage growth is gradually decelerating across the CEE3 and Turkey, weakening a key driver of household consumption. Together with higher inflation, this is likely to constrain spending. However, CEE3 savings rates remain only slightly below 2020 levels, giving households some capacity to maintain consumption and absorb price shocks, including those linked to US-Iran tensions. Romania is the regional exception: real wage growth turned negative in recent months and returned to zero only in September, although this should support a recovery in consumption next year.

CEE3 inflation is currently driven mainly by fuel prices, while unexpectedly weak food inflation has limited the rise in headline rates. We expect this to reverse in the coming months. Global agricultural commodity prices are at their highest since 2022, and local

harvest data and producer prices point to an imminent increase in food inflation. El Niño adds another risk, although its historical impact on EMEA has been smaller than elsewhere. The pass-through from higher household energy costs has also yet to reach CPI; it typically takes 6–12 months and is often concentrated in January because of fixed-term contracts. We therefore expect both headline and core inflation to peak next year. Average inflation should rise from 2.7% this year to 3.1% next year before easing to 2.3% in 2028. Romania and Turkey remain idiosyncratic cases. In Romania, the base-effect spike from tax changes linked to fiscal consolidation has passed, and inflation should fall from 8.5% this year to 4.7% next year. In Turkey, EMEA's most energy-sensitive economy, disinflation stalled earlier this year but has recently resumed; we expect average inflation to decline from 30.8% this year to 25.0% next year.

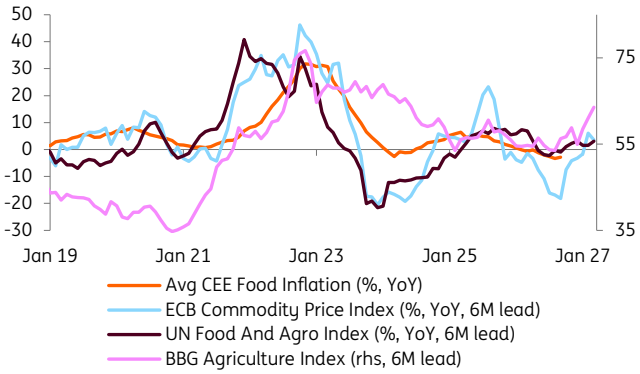
Fiscal policy has come under renewed pressure to loosen as the US-Iran conflict has increased demand for measures to offset high fuel prices and fund greater defence spending. Even so, we expect only a modest widening of deficits next year in the Czech Republic and Turkey, both of which start from much lower levels than elsewhere in EMEA. Hungary and Romania, by contrast, are continuing visible fiscal consolidation. Poland's deficit is set to remain unchanged at the highest level in the region, with next November's general election posing an upside risk.

Fig 10 Wage growth in CEE region slowing down (%, YoY)



Source: Macrobond, ING

Fig 11 Food inflation coming back



Source: Macrobond, ING

Monetary policy has changed little this year, with central banks awaiting clearer evidence on inflationary pressure from the US-Iran conflict and the related supply shock. The CNB is the only central bank to have tightened so far, and our economists expect another 25bp hike in November, with a growing risk of further increases depending on January repricing. The NBP remains relatively dovish; we expect its first hike only in the first quarter of 2027, with 50bp of tightening in total. Given their distinct circumstances and much higher starting rates, the NBH and NBR are still expected to cut by 125bp and 50bp, respectively, although upside inflation surprises could reduce the scope for easing. The CBT paused its cutting cycle after the US-Iran conflict began, but recent developments point to a resumption, with 200bp of cuts expected this year and a further 500bp next year.

Local Markets Strategy: Staying selective amid a hostile global backdrop

EMEA is particularly exposed to higher energy prices because of its heavy reliance on imports. Energy and food also carry large weights in CPI, increasingly clouding the inflation outlook following the double-digit inflation shock of 2022. Our global assumptions of continued US dollar strength, persistently high energy prices, ongoing geopolitical uncertainty and further ECB and Fed rate hikes, add to the pressure on EM currencies. Signs of stress in the eurozone bond market further weaken the backdrop, leaving the EMEA environment increasingly hostile to risk-taking.

This backdrop is evident in the sharp repricing at the front end of yield curves, as markets have partly shifted towards a 2021–22-style scenario of aggressive central-bank tightening. Although our economists do not see the situations as identical, the longer the US-Iran conflict lasts, the more closely the current environment resembles the previous hiking cycle. Front-end rates remain driven mainly by energy prices, while central-bank guidance has had little influence on pricing. Markets imply substantially more tightening than our economists forecast, but without a meaningful global de-escalation it is difficult to take the opposite view.

In the bond space, higher inflation, households' price caps and weaker growth all pose upside risks to fiscal deficits next year. The current global backdrop is generally unfavourable for duration, so we favour strong idiosyncratic stories. Hungary's domestic story remains supportive. Experience elsewhere suggest the HGB spread could converge towards 50–120bp as ERM II entry approaches. It has just reached 200bp, with entry still more than two years away. TURKGBs, by contrast, need a more supportive global environment to draw buyers back despite cheaper valuations and the prospect of an earlier resumption of CBT rate cuts. ROMGBs have tightened to record levels versus CEE peers following positive political developments and now look expensive. CZGBs face a distinctly bearish mix next year: a wider fiscal deficit, record bond redemptions, likely exclusion from the GBI-EM index (a benchmark for local-currency emerging-market government bonds) and further tightening by a highly hawkish central bank. Poland has recently been downgraded and faces the risk of further downgrades next year. Its fiscal deficit is at a record high, the largest in the EU, and next November's general election offers little prospect of improvement. Meanwhile, despite its dovish bias, the NBP has started discussing possible rate hikes.

As with duration, the global backdrop is highly unfavourable for EMEA currencies. A strong US dollar is weighing on EM FX, while the prospect of further Fed and ECB rate hikes is eroding carry returns. We therefore favour currencies that continue to offer attractive carry (TRY and HUF) or support from a hawkish central bank (CZK). We avoid currencies combining economic imbalances, such as current account (CA) or fiscal deficits, with a dovish central bank (PLN and RON).

Hard currency sovereign debt: Another test for sovereign spreads

James Wilson, CFA
Emerging Markets Sovereign Debt Strategist
james.wilson@ing.com

The current environment of elevated core rates, high energy prices and renewed geopolitical risks should pose another test for the resilience of EM credit spreads, which still remain close to all time tights despite some recent risk-off moves.

2026 has been a tough year for fixed income assets, with the sharp move higher in UST yields on the back of a repricing of global central bank expectations acting as a significant drag on total returns in the credit markets. War in the Middle East has also disrupted another EM region, once seen as something of a 'safe haven' in the market. Despite this backdrop, EM sovereign credit markets have held up well – excess returns at the index level are modestly positive, with HY sovereigns outperforming and even generating positive total returns, thanks to their larger spread cushion and shorter duration profile. Weaker performers this year have understandably included GCC names such as the UAE and Bahrain that have faced trade disruption and geopolitical risk, but also lower-beta energy importers such as Indonesia and the Philippines. In CEE the change in government in Hungary has driven decent performance, while political uncertainty weighed more on Bulgaria and Romania. In CIS, Armenia and Uzbekistan have continued their strong performance, backed by fundamental progress.

The move in core rates has been the key macro story, with the US 10Y spiking over 5.3% from below 4% in February and still hovering above the 5% level despite a rebound in recent weeks. The move in bunds has not been as extreme, but still around 50bp higher YTD at over 3.4%, while political noise and wider sovereign spreads in France have also become a topic of interest for CEE euro-denominated bond issuers.

At the index level, EM sovereign spreads are pretty much back where they started the year, having made something of a round trip through this year's volatility. The March selloff saw us 40bp wider, before a sharp rally of 60bp through June, then the latest risk-off moves since late September – this still leaves us at levels tighter than any period since 2006/2007, and we expect further decompression is likely absent a significant shift in the global macro environment.

The narrative from recent years still stands – all-in yields remain attractive at near 7%, while the improvement in EM fundamentals in recent years stands out against a backdrop of fiscal concerns and political noise in the DM world, somewhat blurring the lines for sovereign debt markets. We are somewhat cautious on higher-beta EM sovereigns, but don't expect the global pressures to drive a more systemic crisis in EM.

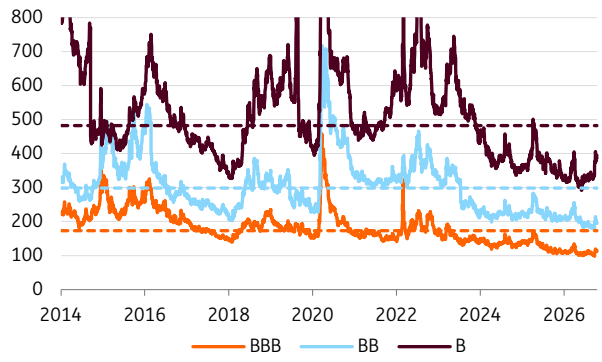
Fig 13 EM sovereign spreads by rating (bp)



Source: Refinitiv, ING

Key themes

- **Domestic political noise takes centre stage:** Despite the Middle East conflict driving big swings in global markets, local political stories continue to be a key differentiator for EM sovereign performance. Elections in Hungary and Bulgaria have seen new governments, while the energy shock is yet to cause widespread protests as government action keeps the impact contained. Romania has had an extended period of interim government, but prospects are looking up for progress there. Looking ahead, we have elections for Serbia later this month, while the political cycle should be restarting for the likes of Poland and potentially Turkey.
- **EU relations in focus:** With the energy shock placing upward pressure on inflation and likely driving fiscal strains, EU funding remains a key pillar of strength for CEE sovereigns. This year's RRF deadline has increased the time pressure on EU funds absorption, while the SAFE instrument adds an extra resource. Optimism in Hungary has largely been driven by both the unlocking frozen EU funds and also a return of euro adoption to the agenda. In Bulgaria, euro adoption has been successfully implemented, while the EDP is a key pressure point on most of CEE for driving fiscal consolidation.
- **Rating moves still positive:** While external conditions are adding a negative shock to fundamentals in CEE, the positive news is that the underlying trend was generally positive heading into the latest energy shock. In the higher quality space, Croatia saw another rating upgrade early this year, while an end to political deadlock in Bulgaria helped drive the outlook back to positive. Poland is more of an outlier here, with a downgrade coming from fiscal pressures. A lot of focus remains on Romania keeping hold of its IG ratings, with political progress a key part of the puzzle, while Hungary will hope to reverse its downward trend from recent years given the new government's direction. The trend of improvement has been strong in CIS, while Turkey also temporarily saw another positive outlook at the start of the year.
- **Issuance slows as inflows dry up:** A busy start to the year saw heavy issuance for EM credit markets in January and February, which allowed for something of a breather in the early stages of the war in the Middle East. This theme continued later in the year, with heavy issuance through to the summer allowing for a somewhat quieter time than usual in September and October so far. One key part of this technical puzzle to keep an eye on is the clear slowdown in EM debt portfolio flows seen from tracking data in September, amid the surge in core rates. EM investors will be hoping this is just a temporary blip, as in March this year.

CEE country views

(Moody's/S&P/Fitch rating; ↑=positive, ↓=negative outlook)

- **BGARIA** (Baa1/BBB+↑/BBB+↑): While Bulgaria entered this year with optimism from the official entry into the Eurozone, underperformance in the market has been driven by political uncertainty, given the snap elections seen in April, along with fiscal deterioration. With the political situation seemingly stabilised for now and a more realistic fiscal path being drawn out in terms of gradual consolidation after this year's budget deficit widening, we see scope for an improvement in performance heading into 2027. Current valuations offer space for compression against the likes of Poland and Croatia, along with the potential to retighten against Eurozone hopeful Hungary.
- **CROATI** (A3/A/A-): With a combination of political noise and fiscal pressures a key worry for much of Europe (both EM and DM), Croatia continues to stand out as something of a safe haven given its relative stability. Steady growth, a sharp reduction in government debt ratios (30% of GDP reduction since 2020) and solid EU inflows mean Croatia continues to see a strong fundamental profile. Valuations put the country as one of the tightest names in the EM space, and tighter than some of the more troubled names in Western Europe, with 5-year paper offering around 20bp in z-spread, and around 60bp on the 10-year. This offers limited scope for further tightening, but Croatia should remain a solid low-beta option.
- **REPHUN** (Baa2↓/BBB-↓/BBB↓): While the overall story remains positive for Hungary, we continue to see less value in the Eurobond market, relative to local markets. FX issuance for the year has been completed, while front-loading supply early in 2027 is likely. The composition of issuance could shift slightly more towards EUR as the country heads closer to euro adoption. As with local markets, a strong and credible budget plan could offer more scope for spreads to compress relative to higher-rated peers. But expectations are already elevated for significant consolidation to be announced, and valuations do not offer much scope for upside. REPHUN €40s have seen spreads compress by 90bp YTD relative to BGARIA €38s, and the pickup for Hungary in general now is in the range of 10-20bp over Bulgaria and 20-40bp over Poland.
- **POLAND** (A3/A-/A-↓): Poland is generally well placed to cope with the energy shock from the Middle East, compared to CEE peers. However, after Moody's downgrade to A3, the focus shifts to the negative rating outlook at Fitch, which has come on the back of persistent fiscal pressures. Strong growth momentum and EU fund inflows mean patience is likely before downgrades lower the rating below the single A level, although noise will likely continue, especially if there is more political noise. Valuations look balanced, with the USD curve continuing to look more attractive than EUR, especially with issuance there likely out of the way for the year.
- **SERBIA** (Ba2/BBB-/BB+↑): Despite some deterioration in recent years (wider fiscal deficit, drop off in FDI), Serbia's fundamentals remain closer to higher-rated IG peers, and generally even stronger than most in the CEE region. The focus remains on pre-election fiscal loosening and energy pressures on the external balance. However, politics remains the point of uncertainty, with upcoming elections bringing at a minimum the potential for further anti-government protests, and more uncertainty about the outcome than any time in the past decade.
- **TURKEY** (Ba3/BB-/BB-): In the Eurobond space, Turkey has held up well despite the global macro volatility in recent months and local investment fund noise. We continue to see fundamentals as relatively stable against a backdrop of higher energy prices and global bond yields. CIS country views
- **ARMEN** (Ba3↑/BB-↑/BB-↑): This year has seen a continuation of fundamental improvement for Armenia, with positive rating outlooks at all three agencies, and

elections that passed without major surprises. While there remains the potential for further positive catalysts from the ongoing peace process with Azerbaijan, conflict in the Middle East leaves Armenia in a more vulnerable position, given the increasing reliance on external inflows. Valuations have cheapened up somewhat versus peers such as Uzbekistan and South Africa in recent months but continue to price in a further rating upgrade to mid BB level.

- **AZERBJ** (Baa3↑/NR/BBB-): The fundamental picture is generally positive for Azerbaijan, with ratings now comfortably in the IG space and Moody's holding a positive outlook. At the same time, the country stands to be a significant beneficiary from the current energy price spike, given its high sensitivity to oil prices in terms of fiscal and external accounts. While there remains some risk of negative spillovers from the conflict in the Middle East given the generally tense relations with Iran and cooperation with Israel, for now this seems well contained. The ongoing peace process with Armenia seems more likely to act as a positive catalyst at this stage, given the progress in recent years. In this context valuations look attractive for Azerbaijan, which should act as a strong defensive play in the event of a more prolonged conflict in the Middle East and persistent oil price spike. The current pickup over Kazakhstan appears to offer decent value, while the sovereign continues to benefit from lower geopolitical risk than oil exporting peer Oman.
- **KAZAKS** (Baa1/BBB/BBB): Overall, the underlying fundamental momentum is generally positive, with fiscal consolidation under close focus, while higher energy prices should offer a modest boost to export and budget revenues. However, as with budget policy, on the issuance front, more quasi-sovereign supply remains a risk in the coming years given tight valuations even within the BBB context. Strong technicals keep the front-end well anchored, while long-end spreads now are broadly in line with higher-rated peers such as Qatar and the UAE.
- **UZBEK** (Ba2/BB/BB↑): The fundamental picture for Uzbekistan has improved significantly in recent years, with narrowing twin deficits amid solid growth reflected in rating upgrades. Fitch's positive outlook suggests there is still scope for improvement to continue, while the stronger credit profile should increase the country's resilience to the current energy shock. An expected catch-up in gold exports, alongside ongoing capital inflows linked to the privatisation pipeline should keep the momentum strong. Against this backdrop, Uzbekistan remains the strongest fundamental story in the CIS region but current valuations don't appear to offer a lot of excitement about potential spread tightening.

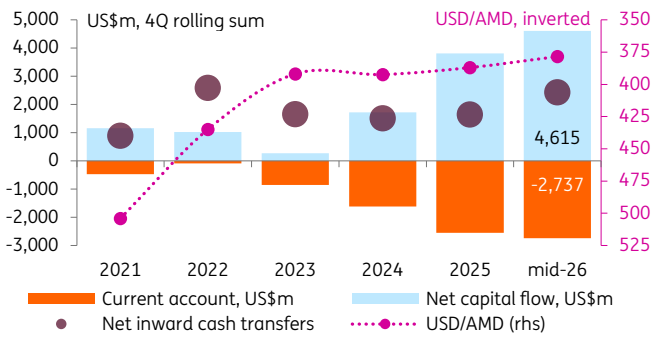
Balance of payments, remittances and Armenian dram (AMD)



Source: National sources, CEIC, ING

Country strategy: Reliance on external flows keeps growing

Armenia has shown remarkable resilience to the global and regional challenges of 2026, supported by renewed inflows of visitors, remittances and capital. Skilful foreign policy manoeuvring and solid finances provide additional support to sentiment and insulation to the balance of payments. However, the increasing reliance on external inflows is a watch factor, as persistent twin deficits and close economic links with Russia remain important vulnerabilities. Higher CPI risks stemming from domestic demand and external cost inputs have prompted the region's first rate hike this year, with further upside risks in sight. While we remain constructive on Armenia's macro outlook and assets, we see growing exposure to foreign politics-related downside risks, while the AMD appears increasingly expensive relative to fundamentals.

Activity: Supported by the new wave of external inflows

GDP growth remains elevated at c.7% YoY on a 4Q rolling basis. Some softening in investment-heavy industries in 9M26 has been offset by stronger activity in consumption, financial services and real estate. Armenia is benefiting from additional visitor arrivals and financial inflows, with net remittances rising from a typical c.6% to c.9% of GDP. Around two-thirds of gross cash inflows originate in Russia, making it a key variable for Armenia's growth outlook. Assuming foreign policy continuity, gradual moderation of GDP growth towards c.5% pa, alongside a stable c.3.5% budget deficit, remains our base case. A material disruption to Russia-related flows of people, goods (including Russia's parallel imports) and capitals remains a downside risk and a factor to watch.

Interest rates: CPI risks triggered a precautionary hike

Inflation has hovered around 4% YoY for most of 2026. Relatively low import exposure to developed markets and c.5% YoY dram appreciation have helped contain price pressures from strong domestic demand and higher global commodity prices. Meanwhile, the deteriorating global inflation outlook, combined with regional and domestic risks, has raised concerns over further inflationary pressures among households, corporates and policymakers. With CPI likely to remain above the 3% target for longer, the Central Bank of Armenia raised the policy rate by 25bp to 6.75% in September. We do not expect this to mark the start of a prolonged hiking cycle but still see the balance of rate risks as skewed upwards.

FX: Supported, but increasingly expensive

The dram has continued to show above-expected resilience to global capital volatility in 2026, as it is supported by rising capital inflows, remittances, comfortable reserves and favourable investor sentiment linked to the peace process with Azerbaijan and positive rating trajectory. This continues to offset Armenia's sizeable current-account deficit, helping keep the currency stronger than implied by long-term valuation metrics. However, Armenia remains structurally dependent on continued external financial flows, while trade deficits and close economic links to Russia remain important vulnerabilities. We therefore expect the AMD to stay resilient to a potential global risk off in the near term but see limited room for further appreciation and continue to view longer-term risks as skewed towards gradual depreciation.

Country strategy: Strong financials, uneven activity

Azerbaijan remains the CCA region's financially strongest sovereign, supported by large and growing fiscal and monetary reserve assets, low public debt and a robust external balance sheet. Higher hydrocarbon prices have strengthened the near-term fiscal and external outlook, as well as domestic confidence in the non-oil sectors. However, weak oil production, limited diversification and subdued private investment continue to constrain potential growth. Inflation is manageable for now, supporting an extended policy hold, although imported price pressures through high exposure to trading partners with high risks of upward CPI surprises, warrant caution. We remain constructive on sovereign resilience and external stability but see structurally modest growth as the main medium-term challenge.

Activity: Recovering now, but long-term growth limited

GDP growth is currently into the second year of below-average growth, dragged down by an underperforming fuel sector at the beginning of the year, reflecting both structural and temporary factors. At the same time, higher hydrocarbon prices support financial inflows, which pass through to the wider economy, supporting confidence in the non-fuel sectors. Retail trade and non-fuel industry output have been accelerating throughout 2026 amid faster lending activity. While the consolidated budget remains in surplus thanks to fuel revenues, the stable non-oil deficit supports domestic demand. Following the extended fuel-led slowdown of economic activity in 2025-26, we expect growth to recover in the medium term. However, the potential growth rate appears capped at 2-3% unless economic diversification accelerates.

Monetary policy: CPI risks manageable, rates on hold

Inflation risks have recently shifted somewhat to the upside, as food prices and higher global transport and commodity costs have renewed pressure on Azerbaijan's producer price index. However, the exchange-rate peg remains a strong nominal anchor, limiting pass-through to consumer prices. With CPI still within the 4±2% target range, we expect the refinancing rate to remain on hold over the medium term. However, further imported inflation linked to developments in the Middle East is the main upside risk, given Azerbaijan's trade exposure to the eurozone and other economies sensitive to global cost input pressures. For now, further policy adjustment appears unnecessary unless price pressures become materially more persistent and tip the CPI sustainably above 6%.

External balance: Buffers reinforced by oil

As on the fiscal side, higher oil prices have materially improved the external outlook, reversing much of the deterioration seen in 2025. As each US$10/bbl of oil price adds annual exports of around 4% of GDP, in 2026F the current account surplus may exceed 10% of GDP. In the meantime, sovereign assets equivalent to 115% of GDP keep growing and continue to provide substantial protection against potential external shocks. These buffers remain the main support for the AZN peg and broader macro stability. Over the longer term, however, declining hydrocarbon production and limited export diversification risk is likely to gradually erode the external surplus. Azerbaijan remains one of the region's strongest external stories, although commodity dependence continues to shape its medium-term outlook.

Country strategy: Getting on the right fiscal trajectory

Bulgaria enters the post-euro period with a stronger institutional and financial anchor, but also with a less comfortable macroeconomic mix. Domestic demand remains strong, supported by rapid wage growth, a tight labour market and robust public investments. At the same time, elevated inflation, accelerating credit and widening twin deficits expose the trade-offs from an increasingly procyclical policy stance. The alignment of bank reserve requirements with euro-area standards has also improved domestic funding conditions, supporting financial deepening but increasing the importance of macroprudential policy as credit growth and property prices accelerate. Low public debt remains an important buffer, but recurring expenditure commitments are gradually narrowing the margin for error.

Growth remains resilient, but increasingly unbalanced

Economic activity has carried solid momentum into the second half of the year, with private consumption and investment continuing to drive growth. However, much of the strength in domestic demand is leaking into imports, while exports and industrial production remain weak. Household spending should continue to benefit from strong wage growth and a tight labour market, while the final phase of RRF implementation should support public investment. Even so, growth is likely to moderate as inflation erodes real income gains, fiscal support becomes less expansionary and rising household debt gradually constrains consumption. The key question is whether the public-investment push can generate a stronger private-investment cycle.

Inflation: Services pressures remain the main concern

Inflation remains elevated, with persistent services pressures, higher energy costs and strong domestic demand offsetting the more recent easing in food inflation. Tight labour-market conditions continue to push up labour costs, while the euro changeover may have generated some rounding and repricing effects, although these do not appear to be the main driver. Disinflation should resume as demand growth normalises, fiscal policy becomes less supportive and the revised minimum-wage framework moderates wage pressures. The outlook nevertheless remains exposed to second-round effects from the fiscal impulse and to the risk of a more prolonged energy shock.

Sovereign credit: Scope for a rebound

While Bulgaria entered this year with optimism from the official entry into the Eurozone, underperformance in the market has been driven by political uncertainty, given the snap elections seen in April, along with fiscal deterioration. With the political situation seemingly stabilised for now and a more realistic fiscal path being drawn out in terms of gradual consolidation after this year's budget deficit widening, we see scope for an improvement in performance heading into 2027. Current valuations offer space for compression against the likes of Poland and Croatia, along with the potential to retighten against Eurozone hopeful Hungary.

Country strategy: Still in good shape

Croatia's economy continues to outperform the euro area, supported by resilient consumption, a tight labour market and the final phase of RRF-funded investment. However, growth has slowed more visibly in 2026, as sticky inflation, rising labour costs and weaker tourism have taken their toll on activity. Fiscal policy remains supportive, although strong nominal revenues should keep the deficit close to 3% of GDP and allow public debt to decline gradually. At the same time, a widening current-account deficit highlights the growing gap between still-solid domestic demand and the economy's external earning capacity. Political stability and a solid sovereign rating remain important buffers, while a key medium-term objective resides in the rotation of the RRF-driven investment and cohesion funding towards greater private investment.

Growth: Domestic demand remains supportive

Economic growth has lost momentum during 2026 and we now expect a GDP annual expansion of around 2.0% for the year, down from 3.4% in 2025. Household consumption has remained robust overall but showed signs of weakness in the second quarter, while investment continued to benefit from the final RRF absorption push and other EU-funded projects. Nevertheless, elevated inflation has been weighing on purchasing power, financing conditions have become less supportive, and net exports remain a drag on output. Growth should remain above the euro-area average, but the end of the RRF cycle means that sustaining investment and productivity gains will increasingly become more dependent on private-sector projects.

Inflation: Easing only gradually

Inflation has eased from its spring peak but remains elevated, reflecting energy costs and vigorous wage growth, with pressures remaining particularly evident across domestic services. While the currently tight labour market continues to support household spending, it has also fuelled price pressures across the tourism, construction and other labour-intensive sectors, adding some headwinds to competitiveness. Tourism should remain an important buffer for the economy, although rising revenues increasingly reflect higher prices rather than stronger volumes. Looking ahead, inflation risks remain tilted to the upside, particularly from renewed energy-price pressures, adverse weather effects on food prices and persistent second-round effects from wage growth and services inflation.

Sovereign credit: No news is good news

With a combination of political noise and fiscal pressures a key worry for much of Europe (both EM and DM), Croatia continues to stand out as something of a safe haven given its relative stability. Steady growth, a sharp reduction in government debt ratios (30% of GDP reduction since 2020) and solid EU inflows mean Croatia continues to see a strong fundamental profile. Valuations put the country as one of the tightest names in the EM space, and tighter than some of the more troubled names in Western Europe, with 5-year paper offering around 20bp in z-spread, and around 60bp on the 10-year. This offers limited scope for further tightening, but Croatia should remain a solid low-beta option.

Country strategy: Higher inflation amid slower expansion

The global negative supply shock has propelled inflation upward and is now also taking its toll on economic activity, delivering a textbook outcome. Renewed growth in regulated and food prices is set to follow punchy fuel price gains, as Hormuz second-round effects start to materialise. Real GDP growth is set to slow to a mediocre pace, while the surge in inflation is set to cap real wage growth at the year turn. That said, manufacturing is proving resilient and will lend support to economic activity. Firms' profitability may erode due to rising input costs amid ample competition. The CNB is likely to opt for a tighter monetary policy, as the weaker koruna contributes to domestic price pressures via galloping import prices. Still, the currency is set to withstand potential bond market turmoil, as fragile French finances may cause the ECB to hesitate. The Czech fiscal position remains comparatively strong, despite some recent easing.

Real purchasing power to come under pressure

Second round effects stemming from the Hormuz conflict are set to foster higher headline inflation over the coming quarters, with regulated and food prices flipping into annual growth at the year turn. The energy distributors have already started passing higher purchase prices on to customers and, with global oil and natural gas prices expected to remain elevated for longer, this is only set to gain momentum over the coming months. Food price tags are set to surge over the coming year, fuelled by higher fertilizer and transport costs. The sub-average crop yields in the Czech Republic and other European countries will only exacerbate price pressures. Furthermore, it is complicated to get Ukrainian crops to the market, given the low level of the Danube River and the Odesa port blockade. A weaker koruna only contributes to galloping import prices. Taking all this into account, we expect average headline inflation to strengthen from 2.2% this year to 3.4% next year.

The punchier inflation will take its toll on real wage growth, which we expect to slow from a robust 4.5% on average this year to 2.6% next year. Such a tangible slowdown in wages would have profound consequences for domestic spending, as it will get tougher for some medium- and many low-income households to make ends meet. Spenders may hit the brakes for precautionary reasons or due to budgetary constraints in anticipation of price surges in essential areas of expenditure, such as electricity, heating or food. Moreover, significant price increases in these segments may readily feed into inflation expectations.

We see an overall nominal wage gain of just below 6% in 2027, despite the plans for robust wage increases in the public sector of around 8% and an 11% rise in the minimum wage. The public sector accounts for up to a quarter of all employed. Firms are unlikely to be willing or able to proceed with upbeat wage rises with profitability coming under pressure. Input costs are surging, while the ability to raise end-prices is limited due to the intense global competition, especially from China. When profit margins erode, firms typically scale back investment plans and rein in wage growth. Against this backdrop, real GDP growth is set to slow to 1.8% this year before only gradually regaining momentum, provided the global environment does not deteriorate further. Given the inflation outlook and the weaker koruna, we expect the CNB to tighten monetary policy further. A somewhat looser fiscal stance may reinforce the case for a hawkish policy bias among Czech policymakers.

Softer housing market to calm future core inflation

Annual house price growth is set to cool noticeably this year from an average of 16% in 2025. At the same time, construction output recorded its first year-on-year drop in August after returning positive numbers for almost two years. We expect this to have profound implications for the still punchy annual gains in imputed rents, which account for just over a fifth of the core inflation basket. Indeed, imputed rents are significantly affected by the cost of materials and labour in the construction sector, along with property price dynamics. We forecast some cooling in the housing market this year, though the timing of the pass-through into core inflation remains uncertain. House price changes seem to take effect almost immediately, while it can take a couple of months for other factors to filter through.

Pressured profitability curbs wage gains

Firms' profit margins have started to come under pressure, already weighing on confidence in September's PMI release. Indeed, energy prices for European manufacturers are significantly higher than those faced by their global competitors. At the same time, China continues to expand industrial capacity and is competing aggressively across a broad range of sectors. Investment plans and wage increases are first to come under scrutiny when profitability dwindles. European ETS1 emission allowances are adding to this pain and contributing to concerns about Europe's industrial competitiveness and deindustrialisation. If ETS2 is fully implemented, we anticipate further pressure on SMEs in particular. Czech industry is moving onto firmer ground, though we believe that the boost from Hormuz-related pre-stocking may fade.

Weaker koruna contributes to galloping import prices

Import prices have continued their upward trend on the back of surging energy and material prices following the escalation of the Ukrainian and Middle Eastern conflicts. The weakening domestic currency has also started to add to import price pressures, largely reflecting the recent sell-off in government bonds stimulated by the global bond market turmoil. In any case, import prices affect all price segments to some extent, and are likely to feed into core inflation with some lag. This adds to the upside risk of an expected inflation surge at the turn of the year, which we believe warrants close attention from the central bank. We saw an acceleration in goods prices in September's CPI and expect more is to come in October.

Higher rates needed to keep inflation in check

Surging inflation is set to keep real interest rates compressed until the middle of next year. Add in the weaker koruna and the general monetary policy stance does not appear restrictive. Given the slowing economy, the koruna's key advantages - the punchy interest rate differential and growth outperformance relative to the eurozone - could lose their luster somewhat. Therefore, we anticipate that the CNB will raise rates in November and attach a 30% probability to another hike in December. Still, we do not see this as the start of a conventional hiking cycle, as the economy is set to continue operating below its potential. In fact, we see the equilibrium rate as higher than generally assumed, as geopolitical conflicts continue and keep resource costs structurally higher. The cost of capital must adjust accordingly if price stability is to be secured.

FX strategy *(with Frantisek Taborsky, EMEA FX & FI Strategist)*

The koruna remains a remarkably stable currency within the EM and CEE space amid heightened geopolitical uncertainty, elevated energy prices and a strong US dollar. We believe the CZK remains a safe haven among its peers for investors. On the one hand, the economy remains resilient to global challenges and supply shocks. On the other, the CNB remains the most hawkish central bank in the region, a stance reflected in aggressive rate pricing that provides a degree of protection.

The interest rate differential remains the primary driver for EUR/CZK, more so than energy prices or the strength of the US dollar relative to peers, in our view. We expect the CNB to adopt an even more hawkish stance in the coming months as our forecast for inflation heads above 4% in January. Conversely, a weaker economy and fiscal issues in the Eurozone are exerting downward pressure on the outlook for front-end rates. Overall, we believe the koruna will retain its safe-haven status within the CEE region and outperform its CEE peers in the face of persistent geopolitical uncertainty and high energy prices.

We expect EUR/CZK to move closer to 24.00 into the year end.

Fixed Income strategy *(Frantisek Taborsky, EMEA FX & FI Strategist)*

The CNB reinforced market hawkish sentiment with an unexpected rate hike in June, making it the only central bank in CEE to tighten monetary conditions so far. Inflation has remained well-behaved to date, but this is expected to change by the end of the year and especially in the first quarter of next year, when our forecast sees inflation temporarily rising above 4%.

The market is currently pricing in roughly 110bp of CNB rate hikes, which remains higher than our own forecast. On the other hand, we see few reasons for market pricing to ease. The front end is driven primarily by energy prices, which are heavily dependent on the geopolitical situation. Consequently, we anticipate that pricing will remain elevated, or that a hawkish CNB will give the market reason to price in even more hikes. Meanwhile, long-end rates are already reaching highs last seen during the Covid years. We believe curves will begin to invert, as happened during the previous hiking cycle.

In the bond market, next year will bring an approximately 28% increase in gross CZGB issuance, driven by a combination of a larger public finance deficit and record-high maturities. At the same time, we anticipate a decision early next year to exclude the Czech Republic from the GBI-EM index (a benchmark for local-currency emerging-market government bonds), which would trigger significant foreign outflows from the market. This, combined with CNB rate hikes, makes us bearish on CZGBs.

Country strategy: Entering the credibility-building phase

Hungary has weathered the recent market storms uncharacteristically well. The antidote is called the "road to the euro". Policymakers have laid the foundations, and the project is entering its credibility-building phase. A credible medium-term fiscal plan, official talks on ERM II and progress towards the Maastricht criteria should put Hungary into a convergence corridor. At the end of that road, we see euro adoption in 2032 at the earliest. If all goes well, interest-rate convergence will follow, while keeping the forint stable remains a must. A 2-3% GDP growth and a 2-3% inflation environment in the years ahead provide solid macro foundations. Targeted measures will support consumption, EU funds and better sentiment will revive investment activity, while new export capacities strengthen external balances. Sovereign rating upgrades from 2027 would be the icing on the cake.

Macro digest

In the first half of 2026, the Hungarian economy grew by 1.8% on a yearly basis, slightly stronger than we expected six months ago. The Hungarian economy has now expanded for five consecutive quarters on a quarterly basis, confirming that it has left behind the preceding three-and-a-half-year period of stagnation. However, the details leave us somewhat less satisfied with the quality of growth. On the production side, agriculture contracted sharply due to the drought and heatwaves. Construction fell due to a lack of both private and public projects, while manufacturing expanded, with services delivering modest growth. On the demand side, household consumption continued to rise at a fast pace, while investment fell by 3.8% YoY, continuing the decline since mid-2022. Hence, the growth structure remained heavily one-sided, with net exports acting as a significant drag mostly due to the booming import activity.

Looking ahead, the short-term outlook remains fundamentally positive, but the recovery is unlikely to shift into a much higher gear immediately. We expect GDP growth of 1.9% in 2026, with consumption remaining the main engine, supported by rising real disposable income and improving consumer confidence. Investment could recover towards year-end as EU funds increasingly feed into activity, although the weak starting point remains a concern. At the same time, net exports are likely to weigh on growth this year. Further ahead, stronger domestic demand and an eventual recovery in external demand could push GDP growth towards 3% in 2027-28. However, nearly four years of stagnating capital stock, weak investment dynamics and adverse demographic trends increasingly limit the economy's potential to sustain growth materially above 3% without creating internal or external imbalances.

Inflation continues to deliver downside surprises. Headline inflation accelerated from 1.3% to just 1.6% YoY in September, significantly less than expected, despite a 5.9% monthly jump in fuel prices. The key message is the continued weakness of underlying price pressures: core inflation fell to 1.9% YoY, while food and services prices declined on a monthly basis. Despite the weaker forint, elevated wage costs and higher energy prices, there is still no sign of a broad-based wave of price increases. The new 2.5% inflation target from 2028 could increasingly anchor price-setting decisions and contain underlying price pressures. Nevertheless, accumulated cost pressures may still be passed on during the usual repricing period, pushing headline inflation towards 3.5% by next summer. We expect average inflation of 1.8% in 2026 and around 2.8% in 2027. Domestic price developments remain consistent with further monetary easing, although external conditions will determine its timing.

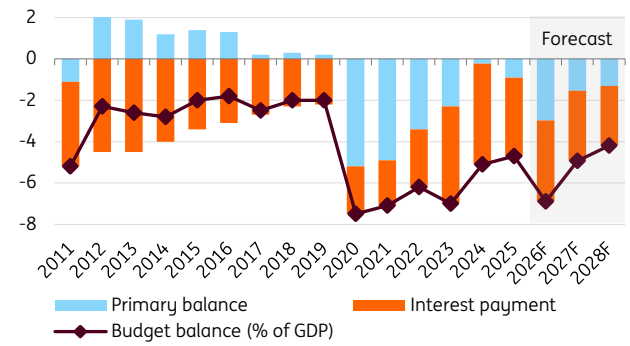
Budget and primary balance of general government (%)

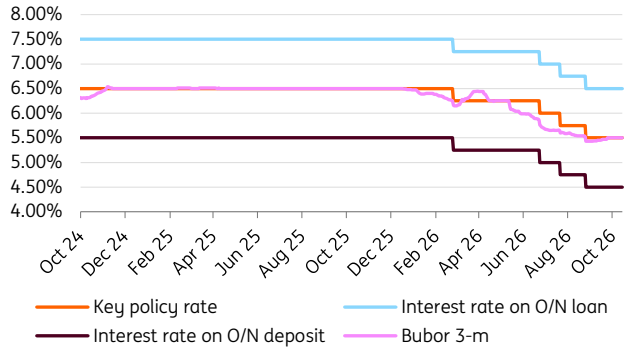


Source: AMECO, ING estimates

Fiscal credibility faces a major test

The revised 2026 budget targets a deficit of 7.5% of GDP, although we see room for an overperformance of around 0.5ppt, mainly due to stronger consumption and strict expenditure control. We expect a credible, front-loaded medium-term consolidation, focused primarily on expenditure and without conventional austerity measures, complying with EDP rules. A declining yield environment should generate sizeable savings on debt servicing, complemented by less wasteful public spending. However, open questions remain on the road to euro adoption. Market-distorting windfall and sectoral taxes will need to be addressed, while the utility cost reduction scheme may also require an overhaul. Consolidation will be a balancing act, but a credible path could clearly strengthen the convergence story.

Benchmark policy rate and interest rate corridor

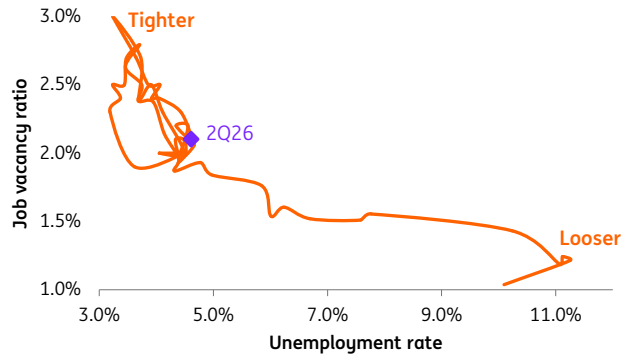


Source: National Bank of Hungary

Further monetary easing is still on the cards

The NBH kept the base rate at 5.50% in September, pressing the pause button after the summer's mini rate-cut cycle. Policymakers have re-enabled a flexible, data-driven approach, leaving the door open for further easing. Domestic conditions certainly support this: subdued price pressures and improving inflation expectations are consistent with lower rates, while the new 2.5% target from 2028 provides an additional anchor. The main constraint is the external environment, with forint vulnerability, elevated yields and energy prices still calling for caution. A credible fiscal path and progress towards ERM II could lower Hungary's risk premium and create room to act. We see one more 25bp cut this year, taking the base rate to 5.25%, followed by another 100bp of easing in 2027.

Unemployment and job vacancy (Beveridge-curve)

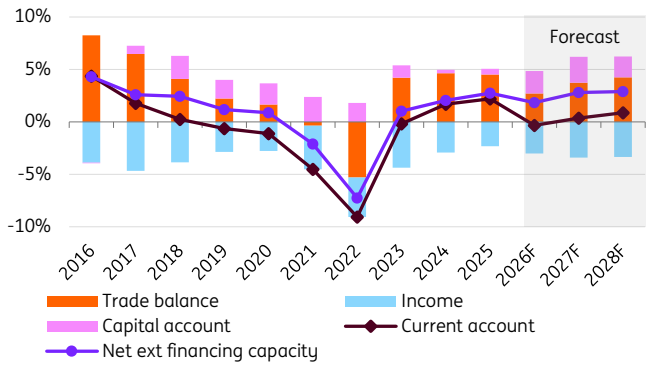


Source: Hungarian Central Statistical Office, ING estimates

The labour market is cracking, but not breaking

The Hungarian labour market is showing signs of weakness again. In August, unemployment rose to 4.7%, while employment declined amid demographic pressures and workforce rationalisation. However, persistent supply-side constraints should limit large-scale layoffs. We maintain our forecast for average unemployment of around 4.5% in 2026, with upside risks from prolonged geopolitical uncertainty. Wage growth is gradually slowing, but real wage growth remains exceptionally strong. The planned 14% minimum wage hike for 2027 looks unsustainable; we expect a rise of around 5%, complemented by personal income tax cuts for below-median earners. Longer term, structural labour shortages and continued wage convergence will increasingly force companies to boost efficiency and productivity.

Structure of the current account (% of GDP)



Source: National Bank of Hungary, ING estimates

External balances to become an FX stabiliser

External balances have remained resilient despite the global energy shock from geopolitics and local weather. The ramp-up of new industrial capacities is increasingly supporting goods exports, while services exports continue to expand strongly. Nevertheless, we expect the current account to slip into a small deficit this year before gradually returning to surplus in the coming years. The financing side should become increasingly supportive as well, with recovering FDI inflows and EU funds significantly improving Hungary's net external financing capacity. Together with stronger export capacity, this should allow the already record-high FX reserves to rise further. This would strengthen a much-needed line of defence on the road to a potential ERM II entry in 2029.

FX strategy *(with Frantisek Taborsky, EMEA FX & FI Strategist)*

EUR/HUF has shown some volatility recently, but the swings have been far more moderate than in the past. Positioning and the euro adoption story provide some insulation from global market turbulence, although the forint remains sensitive to energy prices and broader risk sentiment. The NBH's focus on FX stability and the pause in its easing cycle also provide support.

The next major catalyst should be domestic. We expect the 2027 budget and the medium-term fiscal consolidation plan to provide a credibility boost, especially if accompanied by official talks on joining ERM II. A credible package could significantly reduce Hungary's risk premium and take EUR/HUF towards the 350-355 area in the short term. Improving external balances and rising FX reserves should add another layer of support. Such a move, combined with the benign inflation backdrop, would give the NBH more room to ease and pave the way for a December rate cut.

However, we do not expect the appreciation trend to continue indefinitely. Once monetary easing resumes, the narrowing rate advantage should put the HUF on a mild depreciation path over the subsequent 12 months. We expect a 25bp cut in December and another 100bp of easing in 2027. Yet, with the risk premium structurally lower, we see limited room for a major reversal. This would make 350-355 more of a stepping stone than a new equilibrium. We see EUR/HUF settling around 360-365 as we approach a possible ERM II entry in 2029.

Fixed income strategy *(with Frantisek Taborsky, EMEA FX & FI Strategist and James Wilson, EM Sovereign Strategist)*

Hungary remains one of the most crowded trades within emerging markets, and there is certainly further potential for spread compression relative to peers and core markets. However, the main risks are crowded long positioning as well as the amount of good news is already priced in. At the same time, global factors are once again playing a role in the Hungarian market, and we have seen sell-offs as well across HUF assets since the April elections. We remain bullish on the local story but are looking for better entry levels to re-establish previous exposure. In particular, long-end HGB and rate spreads versus the euro should see further compression, and we expect continued curve flattening here, despite levels already being deeply inverted.

While the overall story remains positive for Hungary, we continue to see less value in the Eurobond market, relative to local markets. FX issuance for the year has been completed, while front-loading supply early in 2027 is likely. The composition of issuance could shift slightly more towards EUR as the country moves closer to euro adoption. As with local markets, a strong and credible budget plan could offer more scope for spreads to compress relative to higher-rated peers. However, expectations are already elevated for significant consolidation to be announced, and valuations do not offer much scope for upside. REPHUN €40s have seen spreads compress by 90bp YTD relative to BGARIA €38s, and the pickup for Hungary in general is now in the range of 10-20bp over Bulgaria and 20-40bp over Poland.

Country strategy: Resilience strong, but upside limited

Kazakhstan continues to benefit from one of the strongest sovereign and external positions in the CCA region, supported by sizeable sovereign assets, a balanced network of international partners and higher oil prices. More recently, strong portfolio inflows given still-attractive real rates, progress towards Euroclear connectivity, growing domestic debt supply and positive rating momentum have supported the tenge and local markets. In addition, a sizeable backlog of future state FX sales provides an important buffer against potential market stress. At the same time, the longer-term outlook remains constrained by persistent twin deficits, limited private-sector investment and capital inflows and an uneven track record in fiscal discipline and inflation targeting. Current CPI trend leaves room for a moderate easing, but the trajectory is facing upside risks.

Activity: Strong growth despite oil disruptions VAT hike

GDP growth has slowed this year compared to the exceptional pace seen in 2025 but remains robust despite the VAT hike and oil-related disruptions. Non-oil sectors continue to perform relatively well, while higher oil prices support confidence and improve the fiscal and external outlook. Domestic demand also appears supported by quasi-fiscal stimulus estimated at 4-5% of GDP. At the same time, retail and corporate lending are showing signs of cooling amid tight monetary conditions. Headline fiscal policy has entered a consolidation phase, reflected in lower reliance on NFRK transfers to finance current spending, although a durable track record of fiscal discipline has yet to be established.

Monetary policy: Real rate to remain high

The moderate easing in inflation from its 2025 peaks and a resilient tenge have allowed the NBK to start cutting the base rate in 2026. Inflation pressures from the VAT hike and global commodity-price spike have remained under control for now, while portfolio inflows and attractive real yields have given an additional boost to the currency. At the same time, tariff increases, fiscal and quasi-fiscal stimulus, and producer-price pressures amid global inflation risks continue to justify our above-consensus CPI outlook. Therefore, we expect the easing cycle to continue only gradually, while remaining alert to potential external inflation shocks. Although Kazakhstan retains room for nominal easing, real policy rates are likely to remain high by regional standards and supportive of capital inflows.

External balance: Portfolio flows increasingly matter

Higher oil prices have strengthened Kazakhstan's external position, although part of the benefit is offset by weaker export volumes. The country continues to run structural current-account deficits as strong imports and dividend outflows offset export revenues. As a result, capital flows are becoming increasingly important for KZT dynamics. Progress towards Euroclear connectivity, positive rating momentum and additional public and corporate debt issuance should continue attracting portfolio inflows amid high real rates, supporting the tenge. We have improved our KZT outlook but note that greater reliance on portfolio capital in an economy with persistent twin deficits also increases sensitivity to shifts in global risk appetite and flow reversals.

Country strategy: Robust growth and fragile fiscal

Poland is set to remain one of the fastest-growing EU economies in 2027, with public and private investment increasingly complementing consumption. Foreign investor exposure to equity and bonds reflects optimism on growth but concern on the fiscal side, with non-residents accounting for 80% of equity trading but only 12% of the POLGB stock. The government is pursuing a supply side agenda to support innovation in the economy, but further structural reforms are needed, particularly on fiscal policy, with a 2025-27 deficit of c.7% of GDP. We don't see fiscal adjustment in the 2027 election year but expect fewer and later NBP hikes (50bp in 1Q27 vs 100bp priced). In our view, elevated hike expectations overstate CPI risks as they also reflect a deterioration of the fiscal trajectory. Hike expectations may quickly compress, if energy prices reverse, but fiscal risks should stay elevated in the coming years as the combination of 2027 election uncertainty and a veto prone President creates risk of a downgrade (1-2 notches downgrade already priced) and is PLN negative.

Investment increasingly complementing consumption

Both economic growth and consumer inflation proved remarkably resilient to the energy shock triggered by the outbreak of war in the Middle East. GDP growth approached 4% YoY in 2Q26, probably marking the peak of the current economic cycle. Headline CPI inflation rose but was contained by a fuel price freeze while the absence of second-round effects kept core inflation under control. At the same time, the authorities maintained an expansionary fiscal stance, resulting in a rapid build-up of public debt. Debt may soon reach the 55% of GDP threshold (local definition), which, under the current public finance law, could require an abrupt fiscal adjustment in 2029. The recent deterioration in the fiscal trajectory together with political gridlock between the government and the president, led Moody's to downgrade Poland's sovereign rating to A3 with a stable outlook. Fitch maintains a negative outlook, while S&P is due to review the rating soon.

The energy crisis brought Poland's easing cycle in monetary policy to a halt, and a prolonged period of elevated inflation could prompt hikes, albeit later and of a lesser magnitude than priced, with our forecast pointing to 1Q27. If a prolonged energy shock does eventually lead to a rise in core inflation and other central banks continue to tighten policy, the zloty could come under pressure. While inflation is generally projected to moderate in the second half of next year, the National Bank of Poland (NBP) may seek to ensure that broader inflationary pressures and second-round effects do not emerge from the current energy crisis. The rise in Polish government bond yields has been driven mainly by global developments and the repricing of US and European sovereign debt.

We continue to expect GDP growth of 3.4% in 2026 and 3.2% in 2027, supported by public investments financed by RRF and cohesion funds, alongside a recent acceleration in private outlays. Household consumption should remain the main driver of economic expansion, but its pace is likely to moderate from 2025 as higher petrol prices and slower wage growth weigh on real disposable income. However, savings accumulated in previous years should provide a cushion to consumers spending.

We expect fiscal policy to remain loose during the 2027 election year, with any consolidation efforts postponed. However, we note the fiscal debate has shifted from a focus on fiscal spending towards optimisation of both sides of the budget. Future austerity measures will probably be needed on both the revenue and expenditure sides of the budget.

Fuel interventions set up a bumpy CPI path in 2027

CPI inflation reached 4.0% YoY in September, moving above the upper bound of the central bank's 2.5% target range (±1 percentage point). However, the increase is mainly attributable to higher fuel prices. Government intervention, through temporary reductions in excise duty and VAT on fuel (2Q26, second half of August, 4Q26), is generating base effects for the 2027 inflation path.

Headline inflation should moderate towards the National Bank of Poland's (NBP) target in 2H27, although its composition is likely to change markedly. We expect lower core inflation and fuel price deflation (strong base effects) to be offset by above-average food inflation due to a poorer harvest, higher fertiliser prices and a low reference base following the current period of food price deflation.

Fiscal policy to stay loose until elections

Higher social spending, substantial increases in public-sector wages, elevated defence expenditure and rising debt-servicing costs have pushed the fiscal deficit above 7% of GDP in recent years. In 2026, the general government deficit is also expected to remain close to 7% of GDP, while the draft budget bill for the 2027 election year similarly envisages an imbalance of around 7% of GDP.

There are currently no credible fiscal consolidation plans in the pipeline, with the necessary adjustment effectively postponed until after the elections, to beyond 2027. The lack of cooperation between PM Donald Tusk's government and President Karol Nawrocki further complicates the implementation of fiscal reforms. While the president has criticised the excessive imbalance, he has also pledged to veto tax hikes and spending cuts.

Rising public debt could force an abrupt fiscal adjustment

High fiscal deficits, combined with non-market borrowing under the EU's Recovery and Resilience Facility (RRF) and Security Action for Europe (SAFE), are driving a rapid build-up of public debt. The local definition of debt (which differs from the ESA definition) is approaching the statutory threshold that, if breached, will require a significant fiscal adjustment.

As early as 2027, public debt under the domestic definition could flirt with 55% of GDP threshold set out in the Public Finance Act. Breaching this threshold next year would require either a balanced budget on a cash basis in 2029 or a deficit consistent with a declining debt-to-GDP ratio. While the fiscal rules could be amended, such a move is likely to be viewed negatively by rating agencies and investors. Moreover, the Polish Constitution prohibits public debt from exceeding 60% of GDP, and securing the constitutional majority required to amend this provision appears unlikely.

Trade gap widens but external balance remains solid

Due to high energy commodity prices and elevated deliveries of military equipment, Poland's external gap is expected to widen to 1.5% of GDP in 2026 and further to 1.9% of GDP in 2027, from a relatively low -1.0% of GDP in 2025. This should reflect a widening trade deficit, also from relatively low levels, while the large income balance gap should be partly offset by a solid surplus in services.

In merchandise trade turnover, China has recently overtaken Germany to become Poland's largest source of imports (based on monthly data). Rising imports are being driven by robust domestic demand but are also partly re-exported to Western Europe. Polish exporters are proving resilient despite weak European demand and rising Chinese competition in both intermediate and final goods.

FX strategy

The zloty has weakened in recent weeks, with €/PLN moving to 4.40 after trading in a narrow range close to 4.30 in 3Q26. The move reflects a less favourable external environment, but also a deterioration in Poland's fiscal outlook. Higher global yields have strengthened focus on economies with high deficit and debt servicing costs, while rate hikes by both the ECB and Fed have narrowed the PLN's positive rate differential, reducing its carry appeal.

Poland is a glass-half-full or half-empty story. On the positive side, GDP growth should continue to outperform the EU, a significant inflow of EU funds (RRF) is still ahead and the rising public debt is partially offset by very low private debt, so the external balance is strong. Also, the PLN could benefit from the conversion of substantial EU funds on the market.

On the negative side, the balance of risks has become less favourable. High energy prices, an escalation of Russia's attacks on Ukraine and intensification of hybrid war with Europe remain key external threats. At the same time, heightened market scrutiny of fiscal positions globally is putting a greater spotlight on Poland's large fiscal deficit and rising public debt, while the approaching October 2027 elections leave little political appetite for fiscal consolidation.

The cross currents, given both the global and local backdrops, are unlikely to support a rapid return to the stronger zloty levels seen earlier this year.

Fixed income strategy

The recent test of 6.5% in 10yr POLGBs was caused by external factors, such as the spike in DM yields, as well as the domestic fiscal story, although the contribution of the latter is harder to determine. US Treasury yields grew amid inflation concerns, higher oil prices and fiscal risks, while the Middle East conflict caused another energy-driven inflation shock and tighter-for-longer global monetary policy stance. In Europe, fiscal concerns are also mounting, particularly in France.

Domestic factors are not supportive for POLGBs either, but much of the risk is already priced in, in our view. The PLN yield curve is pricing an overly aggressive tightening cycle of around 100bp, while we expect the NBP to hike rates by only 50pb (in 1Q27). A repricing of market inflation expectations lower should allow POLGBs yields to decline, but mostly at the short end.

Fiscal risks remain the main domestic vulnerability and can periodically widen asset swap spreads, but near-term technicals are POLGB supportive. Downside rating risk is substantial, given the recent deterioration in the fiscal outlook (higher 2022-26 deficits and absence of fiscal consolidation in 2027 plan) but is also well priced in. On the other hand, strong banking-sector liquidity, sizeable EU fund inflows and robust domestic demand should fund elevated 2027 borrowing needs. Over the mid-term, a gradual global yield compression and resolution of the Iran conflict would support a moderate correction in POLGB yields and local fiscal risks would limit the downside at the long end, while the dynamics of the election campaign remains a wild card.

Country strategy: An adjustment that politics could derail

Romania's macroeconomic adjustment is finally becoming visible, but progress remains vulnerable to political uncertainty. The budget deficit is narrowing and the country has retained its investment-grade rating. However, all three major rating agencies continue to rate Romania at the lowest investment grade with negative outlooks, leaving little room for policy missteps. The political stalemate risks overshadowing fiscal progress and keeping the sovereign risk premium elevated. With the economy quasi-stagnated for almost three years, further consolidation will be difficult. A broad political agreement on the 2027-28 fiscal framework would be the key positive catalyst, improving policy visibility, supporting the rating outlook and allowing fiscal adjustment to translate more clearly into lower funding costs and a gradual recovery in confidence. **At the time of writing (12 October), a new government is expected to be installed in the coming days, with a parliamentary confidence vote likely on 20 October.**

Consumption is stabilising, but the recovery is fragile

Romania's economy remains stuck in a low-growth regime. Real GDP contracted by 0.8% year-on-year in the first half of 2026 and our full-year forecast points to a 0.5% decline. This would extend to almost three years the period in which economic activity has oscillated around stagnation. The adjustment has been concentrated in domestic demand: private consumption subtracted around 1.4 percentage points from growth in the first half, while both private services and industry weakened. Construction and EU-funded public investment provided the main cushion.

The pressure on households has been unusually severe. Retail sales fell by more than 6.0% year-on-year in the second quarter of 2026, after a 5.2% decline in the first quarter, with weakness broadly spread across categories. The drag reflects high inflation, slower wage growth, frozen public-sector pay and pensions, and higher taxes. More recently, however, the pace of contraction appears to have moderated. Our estimate for the third quarter points to a smaller decline in retail sales, suggesting that consumption may be finding a floor, albeit at a low level.

We expect GDP growth to recover to 2.2% in 2027, with private consumption doing most of the work. This forecast rests on a likely return of pension and wage indexation from 1 January, which should partially restore households' real purchasing power alongside declining inflation. The assumption is important: weaker indexation or additional tax measures would leave the recovery more dependent on investment and exports. Conversely, a credible political agreement could improve confidence and reduce precautionary saving, potentially generating a somewhat stronger consumption response.

EU funds remain the other central source of support. RRF implementation has boosted public investment in 2026 and helped to offset the contraction in private demand. With the facility now ended (though payments are still due to be received by the end of 2026), the growth impulse will increasingly depend on completing projects on time and transitioning smoothly towards cohesion-policy funding. The end of the RRF is therefore not necessarily a cliff edge, but it does change the composition of support. Beyond 2026, execution capacity and the ability of public investment to crowd in private capital will matter more than the headline allocation.

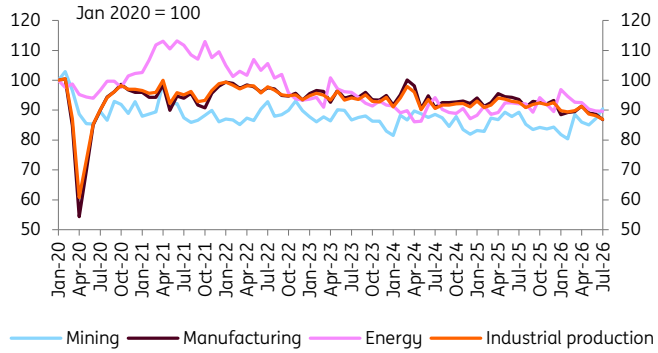
No end in site for industrial weakness



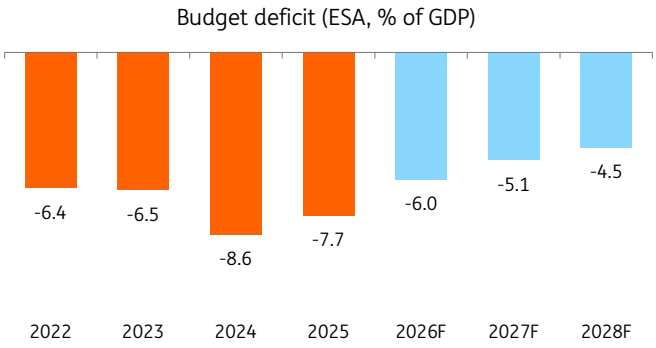
Source: NSI, ING estimates

Low level stabilisation rather than a recovery

Industrial activity continued to deteriorate in 1H26, showing no signs of a genuine recovery. Output contracted by 3.8% year-to-date as weak domestic demand and soft export orders continued to limit production. First-half GDP data shows industry subtracting around 0.5 percentage points from annual growth, confirming that the sector remains a drag rather than a source of momentum.

At best, the recent data points to a low-level plateau. Energy-intensive branches still face high costs, and private investment has not yet generated a meaningful improvement in capacity or productivity. A firmer European cycle and better infrastructure could eventually help, but for now we expect little more than stabilisation, with a cyclical upswing still not on the radar.

Fiscal picture is improving

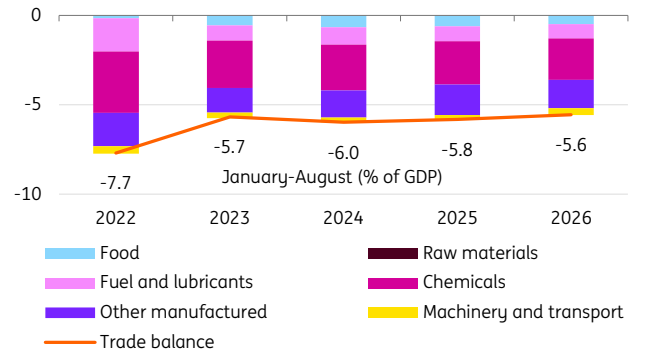


Source: Eurostat, ING estimates

Fiscal repair is becoming visible

The fiscal correction is visible in the cash data. The January-August 2026 deficit narrowed to 2.9% of GDP from 4.5% a year earlier, supported by stronger tax revenues and nominal restraint on wages and pensions. This is a sizeable improvement and keeps the full-year target of 6.2% comfortably within reach. The challenge now shifts to sustaining the adjustment and making it durable. Political gridlock reduces visibility over the 2027 budget and the next phase of consolidation. This is precisely where rating risk is concentrated. The investment-grade rating has been preserved, but the country is not out of the woods. A credible fiscal framework, with clear political support, would help entrench the current adjustment and could stabilise the rating outlook. Without it, better near-term execution may be partly offset by higher funding and currency risk.

Trade balance (YoY%) and components (ppt)

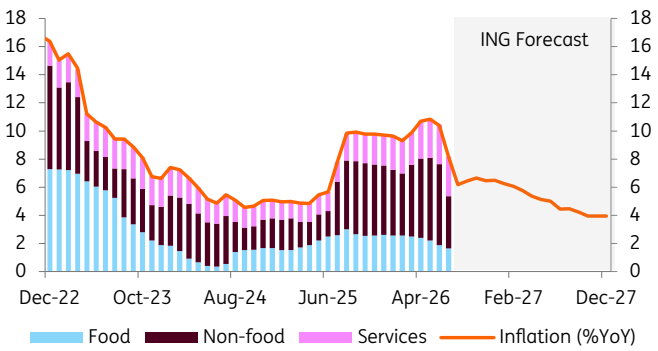


Source: NSI, ING estimates

Weak demand has narrowed the trade gap

The weakness in domestic demand is increasingly visible in the external accounts. Lower consumption and weaker private investment have reduced imports, narrowing the trade deficit and easing the drag from net exports. However, this adjustment reflects softer domestic demand more than improved export competitiveness or a stronger domestic supply response. Looking ahead, a consumption-led recovery in 2027 and a normalisation of private investment are likely to revive import demand. Unless exports and domestic supply strengthen more decisively, progress on narrowing the trade deficit is likely to stall. EU-funded infrastructure could lift capacity over time but, in the near term, some projects will continue to carry significant import content. The external deficit should therefore remain large even as cyclical pressures ease.

Inflation (%YoY) and main components (ppt)



Source: NIS, ING estimates

Inflation is easing but the story remains uncomfortable

Inflation has eased, but its composition remains unfavourable. The sharp decline that started in July was largely driven by base effects rather than broad-based disinflation. Energy and food prices remain a source of upside risk. Underlying inflationary pressures remain persistent. Services inflation continues to reflect past wage increases and elevated labour costs, while compressed margins may be limiting firms' ability to absorb cost pressures. Exchange-rate depreciation also remains a risk, given inflation expectations have stayed above target for several years. The combination of weak activity and sticky domestic inflation remains a key feature of the current macroeconomic picture.

FX strategy *(with Frantisek Taborsky, EMEA FX & FI Strategist)*

The Romanian leu has experienced unprecedented volatility in recent weeks, and overall, the RON has significantly underperformed its CEE peers this year. Although the fiscal situation appears under control for now, political uncertainty and an unclear outlook for the coming years are fuelling market concerns regarding potential rating downgrades and the loss of investment-grade status.

The EUR/RON exchange rate jumped from around 5.250 in early September to its current position just below 5.350. While the market is attempting to stabilise, its future direction depends heavily on domestic political developments. Although the full data set for September is not yet available, a significant drop in banking sector liquidity, reflected in a spike in FX implied yields, is expected. The six-month FX implied yield touched 7.00% in early October, signalling a tightening of monetary conditions. However, we have since seen some easing, with FX implied yields returning close to pre-spike levels.

The NBR's FX reserves stood at €72bn at the end of September, close to record highs. Consequently, we believe the central bank will continue to smooth out EUR/RON fluctuations without managing to fully prevent further upward movement should market pressures arise.

We forecast the EUR/RON exchange rate at 5.350 by the end of this year and 5.450 by the end of next year.

Fixed income strategy *(with Frantisek Taborsky, EMEA FX & FI Strategist and James Wilson, EM Sovereign Strategist)*

As with the FX market, ROMGBs have faced selling pressure in recent weeks; however, valuations have not changed materially relative to CEE peers and we continue to view ROMGBs as expensive. The spread against Polish government bonds (POLGBs) has tightened to below 100bp, the narrowest level since a brief spell in mid-2023. Funding for ROMGBs is proceeding according to plan, with the funding programme roughly 75% complete, and fiscal execution points to a better-than-expected outcome for the year. Nevertheless, the primary driver right now is the future policy trajectory, just as it is for FX. Given the tight spreads relative to peers, we see a risk of a bearish shift and further spread widening from here.

In the Eurobond space, the recent rating affirmation by S&P should offer some relief while clearer progress towards government formation would offer another potential positive catalyst. However, in the near term, resolution of the current political crisis is likely to prompt new issuance in the Eurobond space, acting as a technical headwind. Beyond this, the medium-term outlook will depend largely on the fiscal direction of any new government, with the task of further consolidation now appearing more challenging given political polarisation and a tough external environment. We would prefer to wait for clarity on the 2027 budget before becoming more structurally bullish, with the recent rebound having taken spreads back towards the tighter end of the YTD range versus similarly rated peers.

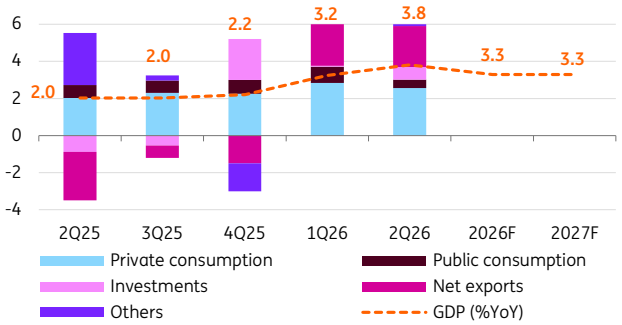
Country strategy: Navigating political uncertainty

Serbia's economy has remained resilient despite elevated domestic and external uncertainty, supported by robust consumption, a strong labour market and continued investment ahead of EXPO 2027. The more supportive fiscal stance, including higher social spending, should sustain near-term demand but could add to both inflation and external pressures. The unresolved NIS ownership issue remains the main energy risk, as the US Treasury's extension lasts only until 30 October. Meanwhile, the 25 October parliamentary election and Aleksandar Vučić's pursuit of the premiership add to the near-term political uncertainty, while Serbia's long-term balancing of relations with the EU, Russia and China has become increasingly difficult against the current geopolitical backdrop.

Real GDP (%YoY) and contributions (ppt)

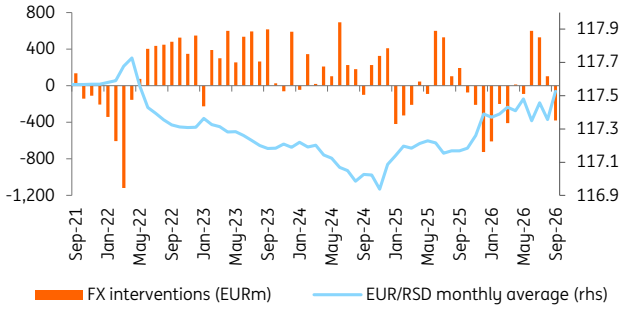


Source: Eurostat, ING estimates

Growth strengthens, but not without trade-offs

Economic activity strengthened during the first half of 2026, with real GDP growth accelerating to 3.8% year-on-year in the second quarter. Household consumption remained supported by rapid wage growth and a resilient labour market, while infrastructure investment linked to EXPO 2027 continued to underpin construction and domestic demand. Nevertheless, the increasingly import-intensive investment cycle is weighing on the external balance, while foreign direct investment remains below its 2024 peak. Growth should remain relatively solid, although the outlook will depend on political normalisation, external demand and a durable resolution of the NIS refinery issue.

FX stability remains the main policy tool

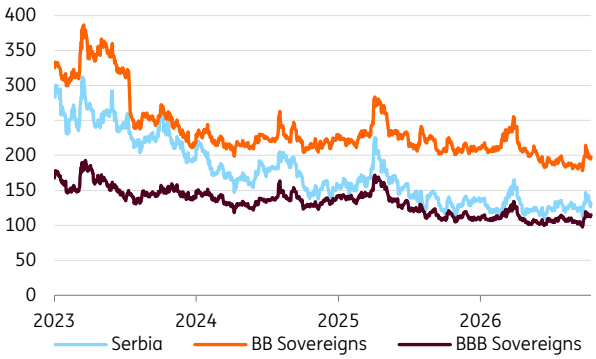


Source: NBS, ING estimates

FX stability to persist; rate cuts delayed

Inflation accelerated to 4.1% in September, returning close to the upper end of the NBS target band and highlighting continued uncertainty around food and energy prices. Against this backdrop, the central bank kept the key rate unchanged at 5.75% in October, making near-term monetary easing less likely. Meanwhile, EUR/RSD has remained broadly stable within the 117.3–117.5 range, supported by official interventions. The NBS sold €475m between January and September to maintain currency stability. We expect the NBS to maintain a firm grip on the dinar going forwards.

SERBIA USD credit spreads (bp)



Source: Refinitiv, ING

Sovereign credit: Stable fundamentals vs political noise

Despite some deterioration in recent years (wider fiscal deficit, drop off in FDI), Serbia's fundamentals remain closer to higher-rated IG peers, and generally even stronger than most in the CEE region. The focus remains on pre-election fiscal loosening and energy pressures on the external balance. However, politics remains the point of uncertainty, with upcoming elections bringing, at a minimum, the potential for further anti-government protests and greater uncertainty about the outcome than at any time in the past decade. We would therefore maintain a favourable fundamental view on the sovereign, but reduce some exposure ahead of elections.

Country strategy: Central Bank (CBT) to remain reactive

The Middle East remains focused on the US-Iran standoff. In this environment, pressure on energy prices persists, creating challenges for net energy-importing economies such as Turkey. Domestically, the closure of certain investment funds prompted some investors to unwind money market fund positions, although dollarization pressures remained contained. CBT reserves declined in September amid weaker confidence, while maintaining strong reserve buffers remains important for absorbing potential shocks and preserving the exchange rate as a key policy anchor. Slower economic activity, softer domestic demand, low core goods inflation and easing services inflation have reduced upside inflation risks, leading the CBT to lower the effective funding cost. Markets continue to expect further rate cuts this year, although reserve volatility and investor confidence remain important considerations for the CBT.

Macro digest

Elevated borrowing costs and macroprudential measures, which were tightened further in May, appear to be contributing to a more pronounced slowdown in second-quarter 2026 GDP growth. Domestic demand, particularly private consumption, has continued to lose momentum, making its weakest contribution since 2024 as spending adjusts to tighter financial conditions. At the same time, net exports have returned to positive territory and are providing support to overall economic activity. On a sequential basis, growth was held back by weaker private and government consumption, although this was largely offset by a strong contribution from net exports. The economy is on a moderating growth path in the second half of this year; however, the recent disruption in investment funds is likely to place additional pressure on domestic demand, increasing downside risks to our full-year GDP growth forecast of 2.8%. Compared with the previous plan, the new 2027-2029 Medium-Term Plan (MTP) projects a growth composition with a larger contribution from private consumption, a significantly higher inflation trajectory, stronger primary spending and a wider current account deficit next year. These projections come ahead of elections that, according to signals from the government bloc, are likely to be held in early 2028. Against this backdrop, GDP growth is expected to accelerate to above 4% next year. A potential resolution of the Gulf conflict could support growth prospects, while any further escalation would add to already high downside risks.

Lower-than-expected September CPI contributed to a further decline in annual inflation. Given still high energy prices and unanchored inflation expectations, we see end-2026 inflation at 29.0% though risks are on the downside with weakening demand. The latest MTP revised the 2027 inflation forecast upwards to 21%, compared with 9% in the previous plan. The new projection is broadly in line with the 21.9% consensus in the Market Participants Survey. The upwards revision to the 2027 forecast was driven partly by the carry-over impact of higher-than-expected inflation this year on the following year's starting point, and partly by the global economic backdrop. According to CBT calculations, the impact of the US-Iran war and related global developments on 2026 inflation is estimated at around 7ppt. After eliminating war related factors, inflation would be below 25%. The new 2027 inflation forecast indicates that the disinflation process has been pushed back further in the current stabilisation programme, in place since mid-2023. Uncertainty surrounding oil prices - along with their spillover effects on other commodity prices - continues to pose risks to the inflation outlook as well as to the expected fiscal impulse envisaged in the MTP. Accordingly, we forecast inflation next year at 25%, with risks on the upside.

Labour market stability conceals rising pressures

The seasonally adjusted unemployment rate has remained broadly stable in the 8-9% range since mid-2024, occasionally falling below 8% and reaching 7.8% in August 2026. As job creation has been largely flat, the relatively low unemployment rate mainly reflects a gradual decline in labour force participation from nearly 54% to 52.5%. Broader labour market indicators suggest increasing strain, with the underutilisation rate, which includes the unemployed, the potential labour force and time-related underemployment, rising to 31.0%, close to an historic peak. Meanwhile, asset quality is gradually weakening, largely due to consumer lending. Although the overall NPL ratio remains historically low, rising GPL ratios warrant caution and may require further restructurings, potentially accelerated by recent fund-related stress.

External risks are still alive

The current account deficit has been on a widening trend, while capital flows have remained volatile recently. The trajectory of the current account balance is expected to be influenced by a mix of external risks alongside domestic demand conditions. In this regard, geopolitical shocks increase upside pressures on the deficit given the elevated trajectory of oil and gas prices. The signing of an agreement between the US and Iran, on the other hand, should be supportive with easing pressure on energy prices. The government forecasts a current account deficit of 2.6% of GDP in 2026, followed by a gradual improvement in subsequent years. While the new projections are higher than those in the previous plan, the elevated and gradually increasing growth path outlined in the MTP raises doubts over whether a narrowing of the current account deficit can be achieved.

Fiscal outlook faces energy-related pressures

The budget deficit has remained below the government's target. However, the fiscal burden from energy subsidies is expected to continue in the near term as elevated global energy prices remain a challenge. We forecast a 2026 budget deficit of 3.3% of GDP, with lower capital expenditure and resilient tax revenue partly offsetting subsidy costs. The MTP projects a central government deficit of 3.1% of GDP, rising to 3.5% in 2027 before declining to 2.8% by 2029. Although most earthquake-related reconstruction spending has been completed, total spending is expected to rise from 23.0% to 24.5% of GDP, mainly due to higher current transfers, reserve allocations and interest payments. Stronger revenue collection, equating to around 1% of GDP, should provide a partial offset, while fiscal policy is intended to support disinflation.

CBT's targeted support for liquidity and SMEs

The CBT has introduced targeted measures to support market liquidity and SME lending. The SME loan growth limit was increased from 4.5% to 5.0%, reversing the tightening implemented on 23 May. The Bank also lowered the share of TRY required reserves held in blocked accounts, giving banks greater flexibility in liquidity management without changing overall reserve requirements. These steps are designed to address temporary liquidity and credit pressures rather than signal a broader easing of monetary policy. Meanwhile, loan growth has slowed due to the macroprudential measures introduced in May and the continued tight policy stance. TRY-denominated loans remain the main driver of commercial lending because of stricter FX lending limits, while weaker momentum in TRY SME lending has widened the gap with non-SME lending.

FX strategy *(with Frantisek Taborsky, EMEA FX & FI Strategist)*

Fund volatility has had little impact on the dollarization ratio for deposits and mutual funds. TRY funds recorded outflows of around TRY580bn between end-August and 14 October as some investors seemed to be unwinding their money market fund holdings (the amount excludes price effects and funds for which trading was suspended, though it has been hard to fully track activity since 15 September as some funds shifted to monthly valuations). On the other hand, we estimate that outflows in FX- and gold-linked assets held in funds stood at US$2.8bn. Recent increase in TRY deposits and repos suggests that dollarization remains contained.

Following more than US$30bn net FX purchases between June and August, the CBT's net FX sales came in at US$8.5bn between 1 September and 9 October. We see US$2.0bn net portfolio outflows, US$3.0bn swap outflows, US$3.1bn increase in residents' FX-linked assets (netted across banks and funds), and a US$1.1bn increase in residents' gold deposits (parity-adjusted), which leaves us US$4.3bn to account for. Hence, we think roughly half of the net FX sales were related to residents' FX demand in this period with corporates having a higher weight. While the CBT recently adjusted the pace of FX depreciation higher, it is likely a mechanical move rather than a shift in FX policy.

We continue to favour TRY for carry trades, anticipating that the carry return will continue to outweigh depreciation.

Fixed income strategy *(with Frantisek Taborsky, EMEA FX & FI Strategist; James Wilson, EM Sovereign Strategist)*

Given the September CPI outcome and weakness in domestic demand, we see the policy rate at 35% by the end of 2026 following two 100bp cuts, at the October and December MPC meetings. The CBT also started purchase auctions on 20 August and, by mid-October, had purchased TRY117.8bn (nominal). According to the Bank, MMFs hold a significant amount of TLREF-linked instruments, which has led them to accelerate bond purchases. Continuation of purchases should also be supportive for bond yields.

The market is pricing in a CBT rate path for this year that is nearly identical to ours but remains significantly more hawkish regarding next year, pricing in a final rate cut that would subsequently be reversed, leaving the rate unchanged. With growing conviction that the disinflationary process will continue, we see room for further curve steepening and lower front-end, while the long end remains elevated amid global uncertainty.

In the Eurobond space, Turkey has held up well despite the global macro volatility in recent months and local investment fund noise. We continue to see fundamentals as relatively stable against a backdrop of higher energy prices and global bond yields. In this context, a decent pickup of 30-40bp over the BB sovereign average remains attractive, despite some tightening in recent weeks.

Country strategy: Macro imbalances due to protracted war

The hryvnia remained under pressure as the dollar strengthened, partly due to renewed Middle East tensions. Consequently, USD/UAH temporarily broke above 45.0, reaching its highest level on record. Hryvnia depreciation could have been sharper, but NBU actions provided support. In September, the central bank raised rates by 50bp to 16.0% and maintained sizeable FX interventions, with the four-week average close to record highs, which demonstrates the NBU's determination to stabilise the exchange rate. FX reserves remain volatile but new tranches of foreign loans should lift them to around US$60bn. The macroeconomic environment remains challenging due to the ongoing war with Russia, despite intensified rhetoric and pressure from the US administration.

Economic stagnation in 2026 due to war disruptions

In 2026, Ukraine's GDP level seems set to remain 20% lower than in 2021, prior to Russia's full-scale invasion in February 2022. The economy has nevertheless shown considerable resilience during the war. However, the intensification of attacks on energy, warehousing and logistics infrastructure has led to severe supply-side disruptions compounded by labour shortages, weighing on GDP growth, which slowed to 1.8% in 2025 and is expected to fall below 1% in 2026. The recent acceleration in inflation has added to these pressures by eroding real incomes and private consumption.

Assuming hostilities continue into 2027, economic activity is likely to rebound only gradually with energy shortages posing an additional risk during the winter months. The geopolitical outlook remains highly uncertain with little prospect of an imminent end to the war despite intensified diplomatic efforts.

Return of double-digit inflation may require NBU rate hikes

Price pressures have increased in recent months as a consequence of intensified Russian attacks on energy, logistics and civil infrastructure and the war in the Middle East (global oil shock). CPI inflation accelerated from 8.1% YoY in August to 10.0% YoY in September, well above expectations. Monthly inflation of 2.1% MoM was the highest since 2015. The surge in inflation was broad-based, and included not only energy and food categories, but also core inflation, which reached 8.8% YoY in September, up from 8.1% YoY in August. Higher food prices surprised despite the relatively robust harvest of grains, fruits and vegetables. War-related disruptions and unfavourable global trends may further fuel inflationary pressures and require additional NBU policy tightening in 2026 and a restrictive policy stance in 2027 to contain second-round effects.

Persistent fiscal gap funded mainly by EU loans in 2026-27

To finance the war with Russia, Ukraine has mobilised substantial internal resources while relying heavily on external financial assistance in the form of foreign loans from international partners. This includes the €90bn EU loan due to be disbursed in 2026-27, which comprises both defence and budget-support components. This has translated into fast rising public and external debt levels, both of which exceeded 100% of GDP in 2025, and are set to rise further in the coming years.

Both fiscal and external current account gaps, as well as public and external debt levels, are set to widen significantly in the coming years. In July, the NBU projected foreign assistance inflows at US$87bn in 2026, US$59 in 2027, and US$33bn in 2028.

Country strategy: Strong growth and gold buffers

Uzbekistan remains our preferred story in the CCA region, combining strong and diversified growth, continued reforms and positive sovereign-credit momentum. An expected catch-up in gold exports, alongside ongoing capital inflows linked to the privatisation pipeline (UzNIF+12 SOEs) is supporting a positive performance from the soum. Combined with fiscal consolidation, this has helped bring the inflation rate down since the start of the year, improving the scope for further monetary easing. At the same time, longer-term vulnerabilities stem from persisting twin deficits, continued high state involvement in the economy and a long history of above-target inflation. A more meaningful monetary easing and a lasting break from UZS's depreciation trend would require a further decline in inflation and more durable private capital inflows.

Activity: Accelerating beyond potential

Uzbekistan's GDP growth has been exceptionally strong recently, supported by domestic demand catching up from a low base. While activity is expected to moderate from the current above-potential levels, Uzbekistan should remain one of the fastest-growing economies in emerging markets. Strong investment spending, industrial activity and ongoing reforms continue to support expansion, while positive demographic trends provide an additional tailwind. A gradual slowdown in the GDP growth is likely to reflect normalisation in the activity trends, with growth remaining comfortably above regional peers. Uzbekistan's challenge is increasingly one of managing overheating pressures rather than finding additional sources growth in consumption and investment.

Monetary policy: Scope for gradual easing

Over the past couple of years, inflation in Uzbekistan has moderated substantially from previous highs, aided by the recent fiscal consolidation, and this has created room for a cautious monetary policy easing cycle. However, current CPI remains above the central bank's long-term objective, while strong domestic demand, administrative tariff adjustments and global food and commodity risks argue against aggressive rate cuts. We therefore expect the central bank to deliver only gradual easing from a still-restrictive level. Real rates remain relatively attractive and should continue to support macro stability while allowing policymakers to balance growth objectives against the need for further disinflation.

External balance: Gold and capital inflows support UZS

Our stronger-than-consensus medium-term view on the soum continues to be reinforced by recent developments. High real rates, gold prices, an expected catch-up in physical gold exports and growing foreign participation in Uzbekistan's privatisation programme provide important support for the balance of payments and FX market. This should underpin the resilience of the UZS despite the country's persistent trade and current-account deficits. However, the longer-term outlook is less certain, as Uzbekistan continues to run sizeable twin deficits, while inflation remains above target. As a result, we view the UZS positively in the near term but believe a durable break from the historical depreciation trend would require sustained progress in reducing macro imbalances and deepening structural reforms.

Impact macroéconomique du mouvement des gilets jaunes : une estimation difficile à ce stade

Estimer l'impact économique du mouvement des gilets jaunes est un exercice difficile et incertain à la date de finalisation de cette *Note de conjoncture* (13 décembre 2018). Ce mouvement, qui a pris une forme assez inédite, a en effet commencé à la mi–novembre, soit relativement récemment, et se poursuit encore au moment où s'achève la rédaction de cette *Note*. Très peu d'indicateurs macroéconomiques sont donc connus à ce stade.

Centré au départ sur la hausse des prix du carburant automobile, le mouvement des gilets jaunes s'est ensuite élargi à d'autres revendications, notamment sur le pouvoir d'achat. Il a surtout pris la forme de blocages routiers, mais aussi de manifestations parfois émaillées de violence, à Paris comme en province et outre–mer.

Si ce mouvement ne comporte pas de précédent historique directement comparable, on peut tout de même tenter de lister les canaux par lesquels il est susceptible d'affecter l'activité économique.

Un impact probable sur la consommation, notamment de services

Du côté de la production industrielle, les blocages de routes et de dépôts pétroliers ont pu engendrer des retards de livraison et certaines entreprises peuvent pâtir de problèmes d'approvisionnement. Néanmoins, ces blocages semblent à ce stade d'une ampleur moindre que ceux qui avaient affecté l'activité économique pendant, par exemple, les grèves massives de décembre 1995, lesquelles avaient ôté environ 0,2 point à la croissance trimestrielle du PIB.

En revanche, le mouvement des gilets jaunes est de nature à pénaliser la consommation, localement assez durement, et par plusieurs canaux. Tout d'abord, les blocages, notamment routiers, ont pu conduire les ménages à reporter ou annuler certaines dépenses. Les dépenses en biens peuvent certes être en partie reportées. Mais cet effet de report est en général moindre pour les dépenses en services (en particulier dans l'hébergement–restauration, les loisirs, les transports) qui pourraient donc connaître des pertes sèches plus marquées.

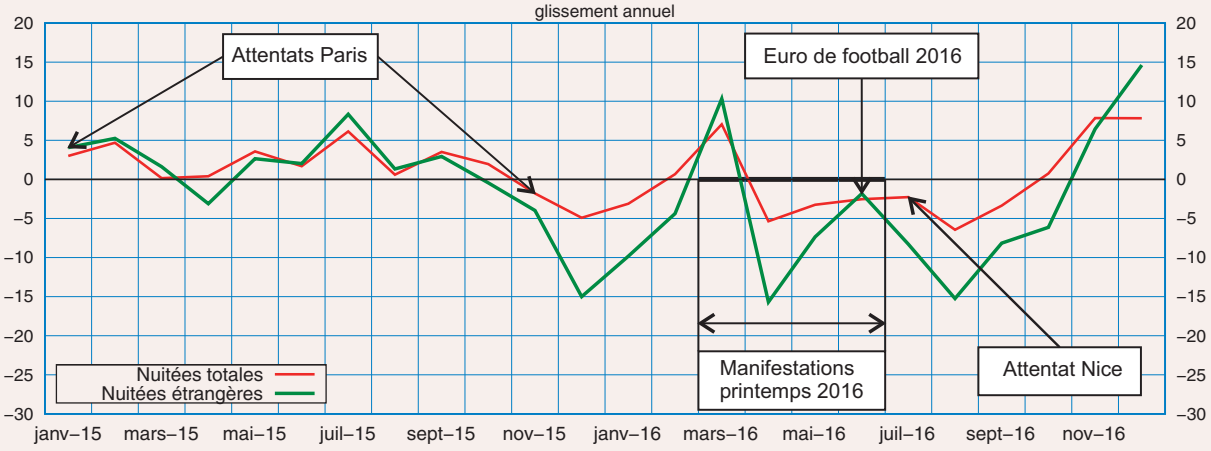
Un effet sur le tourisme

Car, aux effets directs des blocages, s'ajoute le caractère anxiogène des scènes de violence qui ont marqué le mouvement, en particulier les samedis 24 novembre et, plus encore, 1er et 8 décembre. Certaines se sont déroulées dans des lieux symboliques du pays et hautement touristiques (avenue des Champs–Elysées et Arc de Triomphe à Paris). On peut donc s'attendre à ce qu'elles pénalisent les activités liées au tourisme.

La France a déjà connu des épisodes émeutiers, par exemple en novembre 2005. Les données disponibles suggèrent néanmoins que ces événements n'ont sans doute pas eu d'impact significatif sur l'activité touristique. Celles-ci concernaient alors la région parisienne, mais pas le cœur touristique de la capitale. À l'inverse, les attentats de novembre 2015 à Paris, évènements de nature certes très différente, ont pesé pendant plusieurs mois sur le tourisme, ôtant 0,2 point de PIB à la croissance annuelle de 2016 (cf. Insee, 2016 et Beatriz, 2018).

À titre illustratif, la chronique des glissements annuels des nuitées dans les hôtels figure sur le graphique ci–dessous pour la période 2015–2016. La fréquentation touristique dans l'hôtellerie a nettement baissé après les attentats de novembre 2015 (*graphique*). C'est – logiquement – la clientèle étrangère qui a été la plus touchée. L'attentat du 14 juillet 2016 à Nice a sans doute eu un effet du même type, même s'il a été moins marqué. Au moins deux autres évènements ont vraisemblablement eu aussi un impact sur cette série durant la période considérée : les manifestations du printemps 2016, dont la violence ponctuelle n'était néanmoins pas comparable à celle du 1er décembre 2018, et, à l'inverse, l'Euro de football organisé en France en juin et juillet 2016.

L'évolution de la fréquentation touristique dans l'hôtellerie a été heurtée par de nombreux événements en 2015 et 2016



Note : les données sont brutes
Source : Insee, Enquête de fréquentation dans l'hôtellerie

En novembre 2018, la confiance des ménages dans la situation économique a nettement baissé

À côté des principaux indicateurs macroéconomiques, les enquêtes de conjoncture auprès des entreprises et des ménages permettent d'avoir une idée de la manière dont les acteurs économiques envisagent leur situation à venir.

Mi–décembre, les résultats des enquêtes de conjoncture de l'Insee auprès des entreprises ne sont pas encore disponibles pour la période postérieure aux manifestations émaillées de violence. Le mouvement des gilets jaunes ayant commencé le 17 novembre, les chefs d'entreprise n'ont pas pu les prendre en compte dans leur réponse à l'enquête de novembre.

L'enquête de conjoncture auprès des ménages affiche quant à elle une nette dégradation de l'indicateur synthétique de confiance en novembre. Toutes les composantes de la confiance sont en baisse marquée. En particulier, le solde sur l'opportunité de faire des achats importants chute en novembre ; or ce solde peut être relié à la consommation future des ménages (cf. *éclairage : Que disent les ménages sur leur perception des évolutions de leur niveau de vie dans les enquêtes de conjoncture ?*). Il laisse donc présager une consommation relativement peu dynamique au quatrième trimestre 2018, trimestre pourtant marqué par des mesures fiscales (baisse de la taxe d'habitation et des cotisations salariales) venant augmenter le pouvoir d'achat des ménages.

Le mouvement social pourrait également peser sur l'emploi

Enfin, le ralentissement de l'activité lié au mouvement des gilets jaunes pourrait également affecter la dynamique des créations d'emploi. Par exemple, certaines embauches de contrats courts ou d'intérim prévus dans les magasins à l'occasion des fêtes de fin d'année pourraient finalement ne pas se concrétiser à cause des blocages.

Au total, le scénario de cette *Note de conjoncture* fait l'hypothèse que le mouvement des gilets jaunes pourrait ôter 0,1 point à la croissance du PIB au quatrième trimestre 2018, via les secteurs d'activité sans doute principalement touchés : commerce, hébergement, restauration, transports… Cette estimation est néanmoins soumise à beaucoup d'aléas, ne serait–ce que sur la durée du mouvement.

From better fiscal headroom to surprise income tax hikes, this is how UK Chancellor John Healey's first budget could surprise investors

Higher debt interest costs look set to drive the level of 'fiscal headroom' from £24bn in March to £10bn. There's a growing sense that Chancellor John Healey would like to get this up to £15bn or higher. The government is set to modestly increase spending on the cost of living, though the total intervention is unlikely to meaningfully top £5bn and it's likely to be mostly billed as temporary to avoid counting against the main fiscal rule. We expect an increase in capital spending of roughly £10bn/year, bearing in mind this is exempt from the fiscal rule dictating that the current budget must be in surplus after five years. To rebuild headroom

against that rule, we expect £5-6bn of tax hikes, likely via a higher Bank Surcharge and possibly broadening the National Insurance tax base.

In short, we don't expect the budget to deliver a material stimulus (or add materially to the already-planned fiscal consolidation). The impact on the Bank of England, which is poised to hike rates in November, is likely to be fairly minimal.

But all chancellors like to keep a rabbit in their hat – and what follows are five ways it could surprise us.

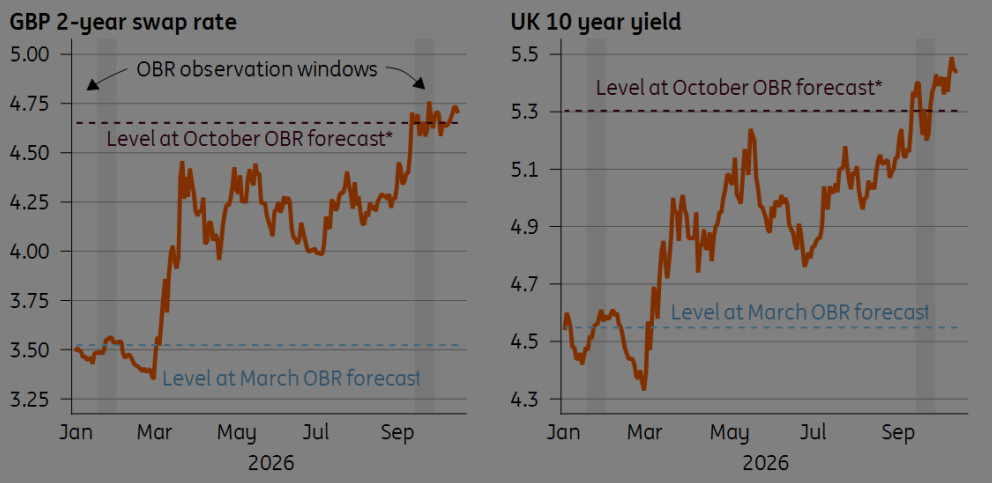
government has left under its main fiscal rule, which requires the current budget (day-to-day spending, including debt interest less revenue) to be in surplus within three years. Back in March, that surplus, or fiscal headroom, was projected at £24bn in 2029/30.

Debt interest costs are rising



*Based on the average rate in the 10 days up to 25 September, which likely represents the OBR's observation window for this budget

growth. Will the rise in energy prices spill into higher pay, just as it did in 2022? We think it won't, not least because the jobs market is much weaker, an assessment we suspect the OBR will share.

But even relatively small upgrades to wage growth can make a big difference to the government's fortunes. Since 2010, the OBR has revised the level of earnings across its five-year forecast by an average of 1.3 percentage points in absolute terms. If it did that now, say by lifting wage growth over the next two years by 0.6ppt apiece, it would add £10bn to headroom, almost perfectly offsetting the hit from higher interest costs.

There are also reasons to think the impact of lower migration projections, which some reports suggest could wipe another £7bn off headroom via lower tax revenue forecasts, could be much less than feared. The starting point for employment looks a little higher than it did back in March. The rise in global equities this year should also be helpful for capital gains tax projections.

Why does this all matter? Because the higher the headroom, the less 'need' there is to hike taxes, and if it is significantly higher than expected, the more room there is to increase spending under the fiscal rules.

substantially smaller real-terms budget increases across the medium term.

Even before the Iran War, government plans pencilled in real-terms cuts to per capita departmental spending in FY2029. Given some functions, like health, are 'protected', that implies much deeper cuts to smaller departments.

Suffice it to say, that is unrealistic. Higher inflation will push up the wage bill across government. It would cost £12bn to simply maintain those March departmental spending plans in real terms. That's before considering the cost of ending that austerity pencilled

in for later this decade, or how the government will fund its defence or social care ambitions.

A top-up to government departments is inevitable – the question is when. It looks like the Treasury wants to kick the can on these tricky budget decisions until next autumn, when it plans to release its next Spending Review, a process of allocating money across departments. No doubt the hope is that debt interest costs will have fallen and the economic outlook brightened, such that there's more space under the fiscal rules to make bigger spending commitments.

all these policy changes affect GDP growth and borrowing over the next year. If there's a material stimulus effect, it could add to market bets on UK rate hikes.

3. A manifesto break on income tax

Tax hikes are likely at the Autumn Budget, but should be very small. We're probably looking at a package of circa £5bn (0.2% of GDP). Part of the problem is that the list of viable options looks perilously small if Labour is to avoid breaking its manifesto pledge not to raise

the major taxes, which together account for around 70% of total revenue.

Our best guess is that the budget will include a hike in the Bank Surcharge (raising £2bn if increased from 3% to 8%), together with a broadening of the tax base for National Insurance to landlords and partners in LLPs (together yielding around £2bn/year). Other options, like ending a loophole on stamp duty for commercial property or lowering the VAT threshold for businesses, have also been on the table.

The problem with many of these measures is that they require

Is
tax – one good, one bad.

The good? A surprise announcement of a so-called ‘tax switch’, a novel proposal from Resolution Foundation which would see the government simultaneously raise basic income tax and cut employee National Insurance by 2ppt. The impact on workers would be neutral, but because income tax has a broader base (including pensions), this would raise £6bn/year.

Though not a substantial sum, it would signal to investors that Prime Minister Andy Burnham isn’t afraid to go near the thorny issue of raising taxes. But in light of recent pension changes,

including to the infamous ‘triple lock’, this feels like too much of a political gamble at this stage.

The negative surprise would be if the Treasury decided to raise the basic tax allowance. Burnham flirted with this on his first day in office; it would not only be expensive (potentially £10bn), but it would also signal that the UK’s commitment to the threshold freeze – which is doing the lion's share of the planned fiscal consolidation – is waning.

4 A big rise in the National Living Wage

The minimum wage increase in April 2027, which will be a

to be growing recognition among Labour figures, including on the left of the party, that the big minimum wage increases, coupled with previous payroll tax increases, have had a big impact on business – particularly in consumer services.

But if the LPC were to recommend minimum wage growth of close to 5%, could the government resist it? In theory, yes. But politically, we suspect not.

5 A surge in bond issuance

We already know that bond issuance is set to increase again in 2027, though for reasons unrelated to the UK’s fiscal trajectory.

The chart below shows that in April, the Debt Management Office projected a gross financing need of £308bn, similar to the big number in FY2025. We suspect that when we get the updated DMO remit following the budget, next year's issuance could be closer to £325bn – though a greater chunk of that will likely get funded using bills, meaning the actual pick-up in gilt sales relative to those previous plans is likely to be more modest.

How debt issuance plans broke down as of March/April

S
borrowing is still likely to be projected to keep falling through the rest of the decade. The major risk – related to some of the things discussed earlier, like larger near-term spending or surprise increases in tax allowances – would jeopardise this fundamental improvement in bond issuance in the medium term. That's something investors wouldn't take kindly to.
