UNITED STATES

Easing US price pressure dampen imminent Fed hike talk

US June consumer price inflation data undershot expectations with the breadth of the softening the particularly encouraging aspect. Fed rate hike pricing has receded, but we still think it is too high. We forecast a prolonged pause from the Federal Reserve

US CPI for June was lower than expected and led by falling gasoline prices

2.6%

Annual rate of core inflation

Lower than expected

US inflation lower than anyone expected

Today's consumer price inflation report for June was considerably softer than expected. US headline prices fell -0.4% month-on-month versus consensus expectations of a -0.1% outcome, while core inflation (ex-food and energy) was flat on the month versus expectations of a 0.2% increase. To three decimal places, it was a negative print of -0.017% MoM. As a

result, the annual headline inflation rate slows to 3.5% year-on-year from 4.2% while core inflation slows to 2.6% from 2.9%.

The details show gasoline prices fell 9.7% MoM, but there were also falls in education & communication of -0.8% MoM, used cars (-0.2%), apparel (-0.6%), medical care fell 0.1% while shelter, the largest component within CPI, rose just 0.1%. New vehicle prices were flat on the month while other goods and services rose just 0.1%. The only real source of strength was recreation (+0.5%), which may reflect the World Cup to a certain extent. The encouraging aspect of this report is the breadth of the softness – it wasn't steep falls in one or two components that offset robust price increases elsewhere. The chart below shows core inflation metrics with the black line representing 0.17% MoM, which is the run rate required to bring core inflation down to 2% YoY.

US core inflation metrics (MoM%, 3M annualised and YoY%)

Kevin Warsh testimony says all the right things

Federal Reserve interest rate hike expectations had been building in recent days, reflecting the re-escalation of the Middle East conflict, the stalling of shipping through the Strait of Hormuz and the move higher in oil and natural gas prices. However, today's relatively benign inflation outcome, showing broad-based softening in price pressures, is resulting in a steep reversal with the 10Y yield down 6bp and 2Y treasury yield down 10bp on the back of the headlines. Yesterday, a July rate hike was seen as a coin toss, but right now less than 4bp of a potential 25bp hike is priced. 50bp of hikes had been expected by March next year as of today's open, but that has since dropped back to 44bp by April.

At the same time, we have had the release of the text to Fed Chair Kevin Warsh's semi-annual monetary policy testimony to Congress, set for 10:00am. It largely echoes his June FOMC press conference. The headlines say all the right things about being vigilant and being prepared to

take action to ensure inflation returns to target – making sure “the inflation surge of the last five years will be a thing of the past”. The headline news outlets are focusing on is that he and the FOMC have “no tolerance” for persistently high inflation, which really shouldn't be any new ‘news’ seeing as the primary role for the Fed is maintaining price stability. As we expected, there is very little there that can be described as ‘forward guidance’ given his disdain for it. Comments in the Q&A about today's CPI print will be the focus – he will surely welcome it, but will likely insist that a series of cool prints will be required.

Four reasons for inflation to slow into 2027

The deterioration in the Middle East situation has led shipping transits through the Strait of Hormuz to collapse after their recent revival and this is putting upward pressure on oil and natural gas prices. Nonetheless, WTI oil at \$80/bbl remains historically consistent with retail gasoline prices of around \$3.75/gallon, below the current level of \$3.85. Should talks resume, and a deal is done, we should see oil and gasoline prices head lower once more.

A second reason, and more important reason, for us to expect inflation to continue slowing is housing. As Fed Chair Kevin Warsh said at the June FOMC press conference, monetary policy doesn't appear restrictive when considering the robustness of financial markets, but it does in light of the housing market. That is hugely important, given that the component with the heaviest weighting in the CPI is shelter, at 35%. Shelter inflation is currently running at 3.3% year-on-year. With home prices barely rising 1% and rents now falling outright in a growing number of states, according to data from Zillow and Realtor.com, we expect this dominant housing component to exert steady downward pressure on overall inflation over the next 12 months.

Thirdly, there are undoubtedly issues around semiconductor prices, but the biggest cost input for US corporates is not tech, tariffs or energy. It's the cost of workers. We've gone from a situation where, in 2022, there were two job vacancies for every unemployed American to being in balance today. This has taken a huge amount of froth out of wages. Moreover, the plunge in the quits rate – a measure of labour market churn – means companies are no longer having to pay up to retain staff. Wage inflation of 3% is fully consistent with 2% consumer price inflation.

Then, rounding out the story, we have tariffs. They represent a one-off step change in prices. Now that we've arguably entered a less onerous tariff regime that includes lots of exemptions, we're increasingly confident that their upward influence on inflation will rapidly fade. The Dallas Fed believes tariffs are contributing around 0.9pp to the annual rate of core PCE deflator. As this drops to zero, core inflation should quickly descend. Moreover, Federal budget balance data showed the IEEPA 'Liberation Day' tariffs, that were struck down by the Supreme Court, are now being repaid to corporate America. In May the section 301 tariffs (the new regime) were fully offset by the initial repayments of the IEEPA tariffs. In yesterday's June data, the Treasury actually paid out \$25.5bn more in IEEPA refunds than it received under all other

tariffs. With perhaps another \$80bn of refunds still to be made, this boost to corporate cash flow should also be helpful in limiting consumer price increases.

A prolonged pause to next summer is our call

We recognise that the Fed has missed its inflation target for the past five years, and Kevin Warsh wants to put an end to this trend. Nonetheless, consumer inflation expectations are within tolerable ranges, suggesting little risk of second-round price effects from the energy spike. Meanwhile, market inflation expectations have plunged, with 10Y break-even inflation rates in line with their 25-year average, while those for 2Y inflation have dropped below 2%. To us, the more likely course of action is for the Fed to hold rates steady for a prolonged period, perhaps until the summer of next year.

European consumers still aren't consuming, but the way they save is changing

Eurozone households continue to act as a brake on economic growth. But a gradual shift from bank deposits towards investment products may be laying the foundations for stronger consumption and domestic demand in the years ahead

Eurozone households continue to save heavily, although more of those savings are now flowing into investments rather than bank deposits.

The issue: Savings inches down, but still well above historical levels

Europe still has a consumer problem. While household spending has picked up modestly in recent quarters, Europeans continue to save a much larger share of their income than before the pandemic, limiting an important driver of economic growth.

For every €100 of disposable income, Europeans spent €85.74 euros on goods and services in the first quarter of 2026, up only marginally from €85.70 in the fourth quarter of 2025. The increase was somewhat stronger compared with the previous two years. From the end of 2023 until mid-2025, the share of income spent on goods and services hovered around €85.

Yet the current 14.26% gross savings ratio (the share of disposable income not spent on goods and services) remains well above pre-Covid levels. During the five years before the pandemic, this ratio was stable at 12.5%, meaning households spent around €87.50 out of every €100 of income on goods and services.

In the US, by contrast, the gross savings ratio stands at 10.2% (4Q2025) and has come down from pre-Covid levels (graph 1). Household consumption continues to provide relatively strong support to the US economy amid solid demand for goods and services. European households remain more cautious, with higher savings acting as a drag on consumption.

Eurozone household savings ratio continues to remain above pre-pandemic levels

Gross household savings rate

Source: Eurostat, OECD National Accounts. Last datapoint for the US is 4Q2025.

The effect: A lack of household spending slows economy

Lower household consumption is weighing on growth*, both relative to historical levels and even more so relative to the US. For years, a gradual normalisation of the savings ratio towards pre-Covid levels was seen as a potential source of support for European growth. So far, there has been little meaningful progress.

In Europe, household spending typically accounts for just over 50% of GDP. If the savings ratio were to fall from first quarter levels to 12.5%, this would imply additional demand for goods and services equivalent to about one percent of GDP. A decline to a level similar to that seen in the US would imply additional demand worth around 2% of GDP.

**If lower household consumption (higher savings) translates into significantly higher household capital formation (higher new residential investment and renovations), it offsets the drain on domestic demand. However, with the [exception of 2021](#) this has not happened. In fact, since 2023, housing investment has declined, further weighing on domestic demand.*

The surprising driver: older households fearing the erosion of their wealth

In [December](#), we looked at the drivers of this change since Covid. We found a striking increase in the share of people who say 'now is a good time to save' relative to 2019. At first glance, this seems counterintuitive. After all, the past four years have been characterised by high inflation, and conventional economic [thinking](#) suggests rising prices lower real interest rates, boost consumption and reduce incentives to save. However, recent research by the [Bank of England](#) suggests that reduced inflation uncertainty, which is strongly correlated with lower expected inflation, leads to higher planned spending and lower monthly saving.

We share a similar view, but emphasise the role of wealth. We've found that the real value of household wealth in Europe fell sharply between 2021 and 2023 as inflation peaked. A similar pattern emerged in the US. But the impact was partly mitigated by higher equity valuations, allowing financial wealth to recover more quickly despite a lower savings ratio.

We also found that the increase in the share of people saying 'now is a good time to save' compared with 2019 was especially pronounced among those aged over 50. This age group has accumulated the most wealth, making them more exposed to the erosion of purchasing power caused by inflation. At the same time, older people tend to have significantly higher inflation expectations than younger people ([chart 6, by age](#)). Households that feel their wealth has been eroded and expect (often much) more to come may attempt to rebuild financial buffers by postponing consumption. As such, we continue to see the erosion of wealth as a plausible explanation for higher savings ratios. Let's see what's changed since then.

The opposing forces: Younger generations savings intentions peak

Since the outbreak of the war in Iran, inflation expectations have risen across all age groups. The increase is strongest among older age groups ([graph 6, by age group](#)). Nevertheless, older age groups seem slightly less inclined to save than before (graph below). This may reflect some individuals expecting to start drawing on existing savings as a buffer, using them to absorb unexpected financial setbacks as fears of higher inflation materialise.

Younger people, on the other hand, are more likely to say that now is a good time to save. We see this as a more traditional response to higher uncertainty, with younger households building up cash reserves for precautionary reasons. In absolute terms, the share of young people saying that now is a good time to save is at its highest level in the past 36 years. However, compared with pre-Covid levels, the increase is still less pronounced than among older age groups.

The data suggest the slight first-quarter dip in the savings ratio reflects two opposing forces: older households appear to be drawing down part of their reserves, while younger households

are stepping up precautionary saving – leaving the aggregate ratio only marginally lower.

There's never been a better time to save

Yearly average of the difference between the percentages of respondents who gave positive and negative replies to the question: 'Over the next 12 months, how likely is it that you will save any money?'

Source: European Commission, ING Research. Data for 2026 is the average from Jan-Jun 2026.

The coming quarters: first down, then up

In the second quarter, the savings ratio likely slipped further as households tapped their financial buffers to offset the surge in fuel costs – a drag strong enough to outweigh any incremental rise in precautionary saving. Looking ahead, with fuel prices easing off their peaks but geopolitical and labour-market uncertainty still high, precautionary saving is likely to re-emerge as the dominant force.

Mortgage dynamics will reinforce this shift. With mortgage rates up roughly 20 basis points in countries like Germany, Italy, Spain and the Netherlands – and uncertainty rising – demand for new mortgages is set to cool over the coming quarters, while repayments are likely to pick up.

Until May, mortgage-debt growth [held steady](#), reflecting the usual lag before shifts in borrowing behaviour show up in the data. A similar pattern was seen in 2022, when the impact of higher interest rates materialised with a delay. However, we don't expect an adjustment of similar magnitude; the increase in mortgage rates has been much smaller. Even so, we do expect to see slower growth in the mortgage debt stock over the next couple of months. Slower mortgage borrowing reduces the amount of new credit flowing into the economy, dampening housing-related spending and limiting consumption growth. At the same time, faster mortgage repayments leave less room for consumption, leading to higher saving ratios.

All in all, we see only limited upside for consumption in the third quarter. Any lift from easing inflation is likely to be muted once again by a rising savings ratio.

What's new: Fewer deposits, more investments

Following the Covid pandemic, eurozone households initially channelled large amounts into bank deposits and debt securities. Since 2024, however, financial transaction data shows an increasing share is going into investment funds (including ETFs), as well as insurance, pensions and standardised guarantees. Over the past two years, net inflows into these assets have consistently outpaced those going into bank deposits.

Investment funds are gaining ground in financial portfolios of households

Quarterly financial transactions of households and NPISHs, 4q moving averages

Source: Eurostat, ING Research

The longer-term implication: positive for growth

Household balance sheets show that as more savings have shifted into investment funds, pensions and other market-linked products – and as asset prices have risen, the share of liquid financial investments in total wealth has increased (graph 4).

Between 2022 and 2025, liquid investments rose by the equivalent of 9% of GDP. Other forms of financial wealth remained roughly constant relative to GDP, whereas currency and deposits declined by almost 5% over the same period. The combined effect of asset price increases and households adding more money to various forms of wealth helped lift the wealth-to-GDP ratio. The gains remain far smaller than in the US, where stronger equity markets – and a much larger share of household wealth in equities and mutual funds – have driven wealth higher far more quickly, even though Americans added relatively less from new savings.

Households are holding more of their wealth in liquid investments

Eurozone household assets

Source: Eurostat, ING Research

Looking further ahead, if Europeans continue to allocate more of their savings to investment products, the need for precautionary buffers could gradually fade. As returns build wealth and offer stronger protection against inflation, households may feel less pressure to set aside such a large share of income to reach their desired level of financial security.

If that shift takes hold, domestic demand could get a lasting boost. Moves like Germany's [pension reforms](#) and the European Savings and Investment Union push in the same direction by encouraging households to hold a larger share of their wealth in investment products. We're not there yet, however.

FX RATES FRANCE

France's Marine Le Pen back in the presidential race as fiscal challenges loom large

Marine Le Pen can now run for president in 2027, setting the stage for a highly uncertain campaign against the backdrop of France's worsening fiscal outlook

RN parliamentary party leader Marine Le Pen leaves the Paris courthouse after hearing of the verdict in her appeal trial

Le Pen can run for president

Marine Le Pen was convicted in March 2025 in a case concerning the misuse of European Parliament assistants by the former Front National. She was sentenced to four years in prison, including two years suspended, fined EUR 100,000, and barred from holding public office for five years with immediate effect. This ruling has now been reviewed on appeal.

The appeal court upheld her conviction today, but modified the sentence. She has been sentenced to three years in prison, including two years suspended, meaning that she will serve one year under electronic monitoring. She has also been banned from holding public office for 45 months, of which 30 months are suspended. As the period of ineligibility began in March 2025, the first 15 months have elapsed. As a result, she is now officially eligible to run in the

2027 presidential election.

On Tuesday evening, she officially announced that she would be the Rassemblement National (RN) candidate in the presidential election and that Jordan Bardella would serve as her Prime Minister if she won. She believes that she will not have to wear an electronic monitoring bracelet because she has decided to appeal to the Court of Cassation, at the risk that the decision might once again prove to be more serious than the one announced today. The Court of Cassation should deliver its ruling at the beginning of 2027. In short, Marine Le Pen has chosen to run for office, but significant uncertainty remains regarding her legal situation, and this is likely to overshadow the campaign.

Where does the campaign stand?

The presidential campaign remains highly uncertain. The number of potential candidates is still very large, reflecting the continued fragmentation of the French political system. French political history shows that opinion polls remain highly volatile nine months before a presidential election. Being the frontrunner at this stage does not guarantee victory.

Three leading candidates currently stand out on the centre-right and right: Édouard Philippe (Horizons), Gabriel Attal (Renaissance, the former party of Emmanuel Macron), and Bruno Retailleau (Les Républicains, representing the traditional conservative right). On the left, Jean-Luc Mélenchon has already announced his candidacy and remains the most visible figure of the radical left. Raphaël Glucksmann is regularly tested in polls as a social-democratic and pro-European candidate. Marine Tondelier (Greens) and Fabien Roussel (French Communist Party) also feature in various electoral scenarios.

What do the polls say?

The most striking feature of recent polling is the RN's lead. The RN's candidate is generally credited with around 35% of voting intentions, well ahead of centrist candidates (typically between 15% and 20%) and left-wing candidates (around 10% to 15% for both Mélenchon and Glucksmann).

Based on current polling, the RN would therefore dominate the first round of the election. However, without knowing whether some centrist or left-wing candidates will eventually withdraw to avoid splitting the vote, it is difficult to identify the RN's likely opponent in the second round. A run-off between the RN candidate and either Édouard Philippe or Gabriel Attal is often discussed, but a unified left rallying behind Raphaël Glucksmann could also lead to an RN-Glucksmann contest.

In the coming months, two issues deserve close attention: the left's ability to unite behind a single candidate and the competition between Édouard Philippe and Gabriel Attal for leadership of the centrist bloc.

Regardless of who wins the presidential election, it is likely that the new president would dissolve the National Assembly shortly afterwards in an attempt to secure a governing majority, as the current fragmentation of parliament severely limits the scope for reforms. If a stable majority were to emerge following both the presidential and legislative elections, visibility on France's economic policy outlook could improve significantly compared with the current situation. But the risk that a stable majority does not emerge is quite large.

What does the RN's programme look like?

Compared with the RN of 2017, the most significant change is its transformation from a Eurosceptic party advocating a break with the European institutional framework into a party seeking to reshape the European Union from within. Proposals to leave the euro area and hold a referendum on EU membership have disappeared from its programme. Nevertheless, the party remains highly critical of European integration and of what it sees as a loss of national sovereignty.

On public finances, the RN regularly criticises European fiscal constraints, the Stability and Growth Pact, excessive deficit procedures, and austerity policies. Its argument is generally that European rules limit the French state's ability to protect the domestic economy. The party also maintains that France's contribution to the EU budget should be reduced.

At the same time, the RN advocates cuts to production taxes and reductions in VAT. Its position on pensions remains unclear. Marine Le Pen initially defended a retirement age of 62 and even 60 for those with long careers, while Jordan Bardella has recently suggested abandoning the focus on the statutory retirement age and instead considering only the number of years of contributions. At this stage, the RN's discourse is much more detailed regarding spending reallocations than regarding an explicit strategy for stabilising public debt over the long term. It is also considerably less committed to a rapid deficit reduction path than centre-right or traditional conservative parties.

Overall, given the precedent set by Giorgia Meloni's government in Italy and the RN's efforts to appear more business-friendly by dropping references to "Frexit", a potential RN victory is viewed by financial markets as less disruptive than in previous presidential elections. However, the party's programme remains highly vague at this stage, and market perceptions could change as policy proposals become more concrete.

That said, even in the event of an RN victory in the presidential election, it appears unlikely that the party would simultaneously secure an outright majority in the National Assembly. The need to form a coalition government could therefore moderate some of the most controversial elements of its programme.

Public finance challenges will weigh heavily on the campaign

The coming months are likely to be dominated by budgetary discussions, which are expected to be particularly difficult. This morning, the government revised down its 2026 GDP growth forecast to 0.7%, significantly below the 1.0% assumption used when the budget was drafted at the beginning of the year.

As a result, the government's objective of reducing the fiscal deficit to 5% of GDP this year from 5.1% in 2025 has become even more challenging. Expenditure is running higher than expected due to rising interest payments on public debt and continued support measures related to the energy shock, while revenue is underperforming because of weaker economic growth. A EUR 6 billion spending cut for this year is currently being discussed, although no concrete measures have yet been identified.

The 2027 budget is likely to be even more complicated given the presidential election campaign. With no parliamentary majority currently in place, the prospects for agreement across political groups on a restrictive budget during an election campaign appear limited. Last May, the European Commission estimated that, under a no-policy-change scenario, France's fiscal deficit would reach 5.7% of GDP in 2027, pushing public debt to 120.2% of GDP, compared with around 100% at the beginning of 2020.

Charlotte de Montpellier

Rates: Bond markets want to see fiscal improvements, regardless of who brings them

Bond markets have shown a muted reaction to the headlines surrounding Le Pen. One reason is that the RN has an alternative candidate in Jordan Bardella, who currently polls slightly ahead of her. Another is that markets remain primarily focused on France's fiscal trajectory.

Current economic headwinds make it more difficult to bring down the deficit, and political uncertainty also muddies the trajectory for coming years. Spreads of 10y French government bonds over their German peers have already widened back towards the 80bp mark in the past week, although the level overstates the widening somewhat given a maturity mismatch between the current benchmark bonds. Looking at an interpolated 10y spread, we are more or less at the average spread going back to when snap elections were called in June 2024, setting off the more volatile environment for French bonds. As such, we still think that markets are lacking the clarity and confidence for material relief in spreads.

Benjamin Schroeder

FX: EUR/CHF the clearest barometer of renewed political risk

The FX market is not currently looking at the French political and budget story. This follows a recurring script of recent years, where France-specific risk emerges as a key driver for the euro only once the bond market shows real signs of stress. For now, FX investors simply aren't concerned about the recent widening in French spreads.

In the run-up to the April election, we expect elevated scrutiny of RN's fiscal plans. Any headlines suggesting a looser approach to fiscal consolidation could spill over into the euro: we would expect that to become primarily visible in EUR/CHF weakness, as the franc is historically the quintessential hedge to EU risk.

For the moment, our baseline assumption is that – barring a surge in support for Mélenchon – any negative euro impact in coming months will likely prove short-lived as the RN and other parties closer to the centre will be careful not to cause serious OAT volatility during the campaign.

Why tech investors are reevaluating AI investments

AI investment remains a positive long-term story for Big Tech, but investors may see slower EPS growth and lower valuation multiples as infrastructure spending increases depreciation costs and reduces share buybacks. We examine the valuation implications for the largest tech firms, and how risks differ for companies from OpenAI to Anthropic

Strong AI demand is clear, but the future returns on today's spending remain uncertain

Future earnings uncertainty may drive equity volatility

We see a positive future for large technology providers, as the adoption of AI-based services continues to increase. Expected revenues are set to climb, as is EBITDA, [as noted here](#). Yet investors remain nervous. Technology stocks have recently shown large intraday declines. During the first half of 2026, Microsoft's share price declined by 20%, while Oracle fell by 27%. Alphabet, on the other hand, rose by 14%.

In this note, we discuss the factors behind this share price volatility. Although we think the overall technology market can sustain heavy investment in new AI data centre infrastructure, earnings per share growth is likely to slow, influencing equity valuations. Broadly speaking, most credit profiles continue to look fine. Nevertheless, some companies such as OpenAI,

Anthropic and Oracle are investing at a pace that exceeds incoming cash flows.

Current investments are up (US\$)

More negative values indicate higher investment spending

Source: Refinitiv, ING

(Fiscal reporting year; Oracle has reported results for 2026)

Not a problem: Investing in building the infrastructure of the future

Despite some occasional doom-mongering by regulators such as the Bank for International Settlements, we think current investments in AI infrastructure are made based on sound economic rationale. For example, Microsoft invested US\$65bn in Cloud and AI infrastructure in F2025, and the company reports annualised run-rate revenues from AI-based services of US\$37bn. This shows there's demand for its investments. Also, technology companies have stated that they cannot deploy AI capacity fast enough to meet customer demand. It means demand for AI computing exceeds supply.

Importantly, most companies can fund these investments through operating cash flow. As a result, industry leaders have little need to take on additional debt, and their balance sheets generally remain strong. The ability to cover investments from existing cash flow can be seen in the chart above (where EBITDA is used as a proxy for operating cash flows). As widely documented, Oracle is a bit of an outlier, with a more aggressive investment programme. This will be discussed below.

EBITDA - Capex (US\$)

Source: Refinitiv, ING

(Fiscal reporting year; Oracle has reported results for 2026)

Investors may wonder when share buybacks will return

As investment spending rises, though, free cash flow (EBITDA less capex) is likely to be lower than in the past, as the benefits to revenue growth may take time to materialise. This reduces the scope for large shareholder returns in the form of share buybacks. As can be seen from the chart below, share buybacks have been material for Microsoft, Alphabet and Meta.

Alphabet has reduced its share count by 9.5% through buybacks from YE20 to YE25. This provided a positive tailwind for its earnings per share (EPS) metric; profits are now divided by fewer shares. Growth in this metric is important when evaluating equity valuations based on EPS. This is because the multiple can fall over time as EPS grows. Although investments can be funded with cash flows, equity investors may need to evaluate future EPS growth and a company's ability to buy back shares.

Share buybacks - historical data (US\$)

Source: Refinitiv, ING

(Fiscal reporting year; Oracle has reported results for 2026)

What to watch when evaluating equity valuations

On a trailing 12-month basis, the Nasdaq trades on a price-to-earnings ratio of around 35x. This is above the 24x level seen at the end of 2022 but below the 40x peak reached in 2021 and 2024. Given expectations for strong earnings growth, however, forward valuations are arguably more relevant. On a two-year forward basis, the Nasdaq trades at around 20x earnings, close to the lower end of its historical range.

Without the support of share buybacks, investors may be less willing to pay 40x earnings multiples in future. The trajectory of EPS growth will depend not only on the revenues generated by AI investments, but also on whether rising costs, including depreciation charges, offset some of those gains.

What if depreciation catches up with capex?

As the first chart shows, investment levels are higher than a few years ago. This matters because these investments must ultimately be depreciated. If revenues from AI-based services take time to materialise, rising depreciation charges could put pressure on operating margins. This risk is particularly relevant for AI infrastructure. Server hardware typically has a shorter replacement cycle than traditional data-centre assets, resulting in higher depreciation rates.

Case in point: Alphabet. Based on consensus estimates, its FY26 capex-to-sales ratio is expected to reach around 44%, while depreciation is projected to be 14% of sales. If depreciation charges rise over time to reflect this higher level of investment, profit margins could come under pressure, creating a headwind for earnings per share. For Microsoft, the equivalent figures are 35% and 14%, while Amazon is expected to post ratios of 24% and 13%, respectively.

During periods of heavy investment, capex typically exceeds depreciation. The AI sector is currently in such a phase. The key questions for investors are whether these investments generate returns above the cost of capital and whether the anticipated revenue growth ultimately materialises.

Company specific sources of uncertainty

As discussed above, we believe most of the uncertainty, and therefore much of the volatility, stems from questions around project returns and fair valuations. However, investors must also contend with several company-specific risks associated with the current AI investment boom. This is particularly the case with Oracle, Nvidia, OpenAI and Anthropic.

How should we look at Oracle's investment objectives?

Oracle has announced ambitious plans to support Project Stargate, a large-scale US AI infrastructure programme. However, its internal cash generation is lower than that of

Microsoft and Alphabet. As a result, Oracle's projected EBITDA less capex is expected to turn negative (based on Refinitiv's consensus forecast), despite the company already operating with relatively low investment-grade credit ratings. While Oracle's balance sheet remains sound, its access to funding is more constrained than larger peers. To preserve its investment-grade rating, the company may ultimately need to raise additional equity capital. So, volatility in Oracle's share price is driven by factors different from those affecting most large technology companies.

Can Nvidia maintain its profit margins?

Nvidia's operating margin could exceed 60% in FY26, according to consensus estimates. This makes sense, as it designs state-of-the-art semiconductors that are in high demand. However, major customers such as Microsoft, Alphabet and Amazon are developing their own custom chips to help manage AI infrastructure costs (capex efficiency). As these capabilities are expanded, Nvidia's pricing power may face greater competition than it has in recent years. This could make today's exceptionally high margins harder to sustain over the long term, even as the company expands into new business lines.

How to view companies developing Gen AI models

Companies such as OpenAI and Anthropic are developing state-of-the-art models for generative AI. They're investing huge sums to become leaders in the field and to develop models specific to customer workflows. OpenAI appears willing to tolerate significant cash burn to establish a dominant position, much as Netflix did in streaming and Amazon did in e-commerce and cloud computing. Yet the long-term economics of AI remain less proven than those earlier industries at similar stages of their development.

AI's long-term value remains uncertain

When evaluating the developments in the market, we don't see evidence of unsustainable investment. How, then, should we explain the volatility in share prices and the steady stream of news articles highlighting concerned investors and regulators? In our view, the market is undergoing a process of price discovery, assessing how to value the future returns from AI-related investments. Key sources of uncertainty include the revenue contribution of AI infrastructure spending, the associated profit margins, and the possibility of slower EPS growth.

Article | 29 June 2026

The economic toll of Europe's record-breaking heatwave

Thermometers, it turns out, have become a leading indicator of economic growth

Heatwaves pose a new downside risk to European growth

Deserted streets and parks, closed schools and cancelled public events. The recent heatwave in Europe brought back memories of the pandemic lockdowns. This time, however, it wasn't a virus but record-breaking temperatures driving the disruption. European countries, including France, the UK, Switzerland and Germany, experienced their hottest days on record for June.

In France, record temperatures brought back horrible memories of the summer of 2003 when some 70,000 people, most of them elderly citizens, died from the extreme heat. What once seemed like a rare exception, even to those sceptical of climate change, is now becoming increasingly common. And as global warming intensifies, today's extremes risk becoming tomorrow's norms, with Europe in the midst of it.

Yet despite repeated warnings and growing awareness, heatwaves still bring large parts of the continent to its knees. A bit like heavy snow does in the winter. Several hospitals declared critical incidents due to the extreme heat, with cooling units breaking down and IT systems stalling, while schools, workplaces and railways were thrown into chaos, and wildfires broke out. People have drowned while trying to cool down, and in France, two nuclear reactors were

forced to close due to a lack of cooling water.

While the record high temperatures during the day and overnight are clearly harmful for human health, they will also leave their mark on the European economy.

Gauging the economic impact of heatwaves

For years, heatwaves were treated the way insurers treat hailstorms: a regrettable but temporary cost, smoothed out over the cycle. That framing is becoming outdated. A [2021 study](#) of Europe's worst heat years (2003, 2010, 2015 and 2018) put continent-wide GDP losses from reduced labour productivity alone at 0.3-0.5% (output, not GDP growth), exceeding 1% in the most exposed regions. Other studies add the costs of cooling and consequently calculate an even larger impact on growth. Add rising healthcare costs, emergency infrastructure repairs and the impact of heatwaves and drought on waterways, transportation or agriculture, and the negative impact on the economy grows further still.

Last year, [a joint paper](#) from the University of Mannheim and the ECB also put a number on the economic damage, analysing the heatwaves, droughts and floods of the summer of 2025. According to the paper, the European economy lost some 0.3% of output. This damage could grow to an accumulated 0.8% by 2029, taking into account the effects of lost productivity, supply chain disruption and depressed tourism revenue.

Previously, the ECB had also estimated that heatwaves and drought could push up food inflation by some 0.4-0.9pp, with that effect potentially doubling over the next 30 years.

In the past, it was tempting for northern Europeans to file heat risk under "somebody else's problem": Madrid's not Munich's. However, the data no longer supports this theory. To the contrary, Germany ranks third among Europe's largest economies for cumulative heat losses up to 2030. Not because German summers will rival Seville's, but because infrastructure, housing stock and labour-intensive sectors like construction and logistics were built for a cooler climate and haven't caught up.

A January 2026 [Climate Analytics assessment](#) commissioned for the World Bank concluded, pointedly, that Germany still lacks comprehensive solutions to manage heat-stress risk, with adaptation planning lagging well behind the science. This conclusion is also confirmed when looking at an increasingly important time series from the European Commission's business survey: weather as a limiting factor to production. It actually shows that over the last few summers, Spain and Germany experienced the most disruptive effects of summer heatwaves.

Heatwaves pose a new downside risk to European growth

Looking ahead, while the recent drop in energy prices should bring some relief to European households and companies, the current heatwaves bring a new downside risk for the European economy: potential supply chain frictions due to low water levels in main rivers and affected

infrastructure like railways and highways, but also productivity losses.

In fact, the uncomfortable truth is that heatwaves have quietly graduated from "weather event" to "macro variable". The thermometer, it turns out, has become a leading indicator.

RATES SPARK

Rates Spark: EUR rates cannot follow a dovish US

Euro rate dynamics remain separated from the US, which is looking more at domestic factors, while oil and gas are primarily driving ECB pricing. Eurozone inflation may take longer to turn, so while both 2y USD and EUR rates look bullish, the US leg could come down first

The rise in Brent oil prices resulted in the 2y euro swap rate approaching 3%, the highest level since the start of the Middle East conflict

Euro rates will need more time to follow a dovish US

Euro rates continue to do their own thing and especially the front end seems relatively isolated from US dynamics. The sharp dovish move in US rates on the back of benign inflation numbers was barely noticeable for the 2y euro swap rate. Oil is clearly the main driver and therefore Brent reaching as high as US\$87 per barrel is a more important variable to watch. At these prices, the 2y swap rate almost hit 3%, which marks the highest level since the start of the conflict.

Also, the eurozone inflation data will be pivotal in challenging the hawkish market positioning, but we may have to be patient. July's figures are still weeks away and even then, those numbers will not be enough to comfort markets about second-round risks. Especially with oil prices surging again, the full pass-through of higher energy prices will remain difficult to estimate. An added complexity is the rise in natural gas prices, which are now at the highest levels since March. Meanwhile, European gas reserves still seem relatively low and will have to

be filled before winter starts approaching.

All this uncertainty means markets' European Central Bank pricing can continue to diverge from the Fed's. The momentum in US inflation should be downwards, whereas for Europe the peak might not be in sight yet, especially if energy prices continue to drift higher again. So, while we are bullish on both 2y USD and EUR rates, the US leg might find itself coming down earlier.

Wednesday's events and market view

While Europe looks to geopolitics and energy prices, the US looks more towards domestic drivers. Following a cooler-than-anticipated CPI release, markets will now watch the producer prices for June as well as the second day of Fed Chair Warsh's testimony to Congress. Other Fed speakers of the day include Williams, Cook and Musalem. The Fed will also release its Beige Book.

The eurozone releases industrial production data for May. From the ECB, Panetta and Nagel will be speaking.

In primary markets, Germany taps three bonds in the 30y area for a total of €3bn.

FX

FX Daily: Benign CPI takes sting out of dollar's upside

The DXY dollar index sold off 0.5% on yesterday's benign US CPI print and 10bp came out of the expected Fed tightening cycle. Fed officials look to be on the same page, requiring several soft inflation prints to avoid tightening, but the June data must be welcome. Today's focus will be PPI and further Fed testimony. High-yielding commodity FX should do well

US inflation came in lower than expected

➔ USD: Softer CPI keeps a Fed hold in play

Yesterday's release of softer-than-expected June CPI was welcomed by asset markets across the board. As [James Knightley writes](#), the softening in prices was broad-based and is a vote in the direction of ING's house call that the Fed will not be hiking this summer after all. Yet, as Chair Kevin Warsh and many Fed members will agree, one number does not a new trend make. And another good speech from [Chris Waller earlier this week](#) serves as a reminder that the Fed will need to see 'several' soft inflation releases to avoid tightening. That explains why, even though short-dated US rates fell 10bp yesterday, the market still prices 44bp of Fed tightening into next year.

Feeding into the above story today will be the June PPI release and more testimony from Warsh. Remember that components of PPI, such as portfolio management fees, airfares and healthcare, all feed into the Fed's preferred inflation gauge of the core PCE reading. The June reading of core PCE is released on 30 June. Thus, any unwelcome rise in any of those components today could reverse more of yesterday's move in the rates and FX markets.

Overnight also saw some [soft Chinese activity data](#) and further escalation in the Gulf. It looks like investors will struggle to price in a benign inflation environment given developments in the energy sector, where both oil and natural gas are on the rise again, while refined products like diesel are surging as Ukraine intensifies its attack on Russian refineries.

While soft US CPI data has taken the sting out of the dollar's upside, it is probably too early to look for a much lower dollar just yet. In this environment, we prefer energy-exporting, high-yield currencies, such as the Norwegian krone, where a 4%+ per annum one-week deposit rate provides reward if volatility drops again in summer markets.

DXY has support at 100.50. We can see that holding while energy prices stay bid.

Chris Turner

📉 EUR: Unwelcome developments in the energy sector

Along with most dollar pairs, EUR/USD very much enjoyed yesterday's soft US CPI release. Were it not for developments in the Gulf and in energy markets in general, we would be happy to call EUR/USD steadily higher from here. But European natural gas is now back to levels seen in mid-March and, as above, it is too early to trade an 'all-clear' US inflation story.

In the absence of a major improvement in energy markets, we suspect that EUR/USD will struggle to break above the 1.1460/70 area and again could move down to the 1.1360/80 area should oil prices deliver another leg higher.

We do note, however, that there seems to be strong demand for EUR/USD sub 1.14. One suggestion could be a rotation into European equities as analysts raise expectations for European earnings. That may be the case, but so far those flows have not shown up in US-listed eurozone equity ETFs, e.g., the iShares MSCI Eurozone ETF.

Elsewhere, a pro-risk environment given lower prospects of Fed tightening, higher energy prices and potentially lower volatility favouring the carry trade all point to the Norwegian krone recovering some of its losses since May. We have a [one-month target at 11.05](#) for EUR/NOK, but the move could easily extend to 10.95. We acknowledge that a soft Norwegian inflation figure this morning has lifted EUR/NOK in early Europe, but we expect good demand for the krone on dips.

Chris Turner

➔ CAD: BoC should show no rush to tightening

The Bank of Canada will likely keep rates unchanged at 2.25% today, in line with consensus and pricing. However, this meeting could be a litmus test for revamped hawkish bets. There is probably little incentive to openly push back against pricing for December (20bp of tightening), but the BoC has equally very few bases to argue for any earlier action. Canada's June CPI may follow the US measure lower on falling petrol prices, potentially falling back below 3.0%. Most importantly, core measures remain very close to 2.0%.

The 2Q BoC business outlook survey showed an increase in inflation expectations, but responses were collected in May, before the reopening of the Strait of Hormuz. The latest re-escalation and improved jobs market picture should keep the BoC open to interest rate hikes, but expect the usual mention of USMCA-related concerns to add a dovish ingredient to the overall message.

We expect few changes in the policy tone by the BoC at this meeting, leaving CAD front-end rates primarily driven by developments in the Gulf. CAD should enjoy more short-term momentum if oil prices stay supported and the BoC doesn't surprise on the dovish side. Still, a sustainable break below 1.40 in USD/CAD requires further dovish Fed inputs, while USMCA headlines may keep offering support to the pair.

Francesco Pesole

⬆ CEE: US inflation brings relief to region

Today's final Polish inflation figures for June should show the full details. Inflation surprised on the downside mainly due to food and fuel prices. Core, however, remained unchanged in our estimates at 3.1%. Official core inflation figures are due tomorrow.

Yesterday, CEE FX saw a clash between higher oil prices and risk-off sentiment due to the escalation of the US-Iran conflict on the one hand and relief coming from lower US inflation on the other hand. We could see new local lows across CEE currencies but also a strong rebound after the US inflation figures yesterday. The easing of Fed hike expectations, which may be just temporary, brings relief for CEE in our view for the coming days. We therefore maintain our bullish view of the koruna and forint and expect the next few days to bring more gains here.

EUR/CZK should also be pushed down due to the hawkish Czech National Bank story locally and we could see levels below 24.200 again soon. EUR/HUF is trickier here due to the very long positioning already, but we still see a case for going lower within the current 350-360 range in our mindset, as investors see cheap levels for forint longs. EUR/PLN, on the other hand, does not see much reason to move down from current levels and we see 4.330-340 as an anchor for now.

Article | 15 July 2026

CHINA

China slowdown worse than expected on weak domestic demand

China's growth slowed to 4.3% year-on-year in the second quarter, the slowest quarterly pace since the pandemic. Though June saw better industrial production and retail sales, the investment slump worsened. Weak domestic demand also weighed on overall momentum. Growth remains within the target range, but pressure for policy support may be increasing

4.3% YoY

China's 2Q26 GDP growth

Worst since the pandemic

Lower than expected

GDP growth undershoots in 2Q as domestic slowdown finally shows in the data

China's second quarter GDP saw a significant deceleration, down to 4.3% YoY from 5.0% in the

first quarter, weaker than forecasts (market: 4.5%, ING: 4.6%). This was the slowest growth in any quarter since the lockdown-impacted fourth quarter of 2022. Through the first half of the year, growth remains within the target range at 4.7% YoY.

The sharp weakening in monthly indicators, which was largely glossed over in the puzzling 5.0% YoY first-quarter GDP print, showed up far more clearly in the second-quarter release. Monthly indicators don't map cleanly into GDP, but the underlying pulse is unmistakably weak: fixed-asset investment has slipped deeper into negative YoY territory, retail sales are barely above zero, and net exports remain negative on a YoY basis — even with strong headline export growth — as a surge in imports overwhelms the trade balance. Inflation was also higher in the second quarter, reducing the data's support from the GDP deflator. We'll have to take a closer look at where the growth is coming from once the contribution to GDP data is released in the coming days. For now, the monthly data suggest a bleak picture all around.

The initial release shows that growth was strongest in the tertiary sector, which grew 5.2% YoY. Strong focus on building out quality services may have buoyed the GDP data, compared to relatively lacklustre growth in the primary (3.7%) and secondary (3.9%) industries.

Tertiary industry continued clear outperformance in 2Q26

June retail sales growth returns to positive territory

Retail sales rebounded to 1.0% YoY in June, up after May's surprise negative read of -0.6%. This beat market expectations (market: -0.1%, ING: -0.1%) essentially for flat growth. Retail sales managed just 1.3% YoY growth over the first half of the year. Services consumption, in contrast, performed better in the same time period, with 5.4% YoY growth in the first half. We expect consumption to continue to shift further toward services, but weak goods sales remain a cause for concern.

The breakdown of retail sales data offers some reason not to be too pessimistic. We see there are several categories which are clear outliers and dragging the overall data in June, and three stories drive these outliers.

- The first story is the rise of China's electric vehicle sector. We see a sizeable drag from auto sales (-16.1%) after demand was front-loaded in previous years and the replacement demand hasn't come in yet, as well as petroleum (-5.1%) falling amid the transition to EVs
- The second story is such as the continued sluggishness of the property market, which is reflected in household appliances (-8.7%), and furniture (-6.6%), and building and decoration materials (-10.5%)
- The third story is the sharp drop in gold prices, which has caused the -3.4% YoY drop in gold and jewellery sales.

Elsewhere, there are still pockets of optimism for consumption. Communications devices (16.5%), cultural and office supplies (12.7%), cosmetics (12.6%), and alcohol and tobacco (12.2%) all saw double-digit YoY growth on the month.

The larger backdrops to the weak consumption story are weak consumer confidence and the impact of China's trade-in policy shifting from tailwind to headwind after front-loading demand in previous years. We are now dealing with the blowback, with beneficiary categories such as autos, household appliances, and furniture particularly hit hard.

We're looking for consumption to be a primary policy target in the second half of the year. This could take the form of another wave of trade-in policy expansion, which may have diminishing returns, or policy support to boost services consumption.

Several key categories account for most of the consumption drag

Industrial production beats expectations amid strong external demand

Industrial production rose 5.3% YoY in June, up from 4.5% in May, and beating forecasts for a more modest recovery (market: 4.6%, ING: 4.7%). This solid read brings the first half industrial

production growth to 5.4% YoY, where it has been one of the strongest domestic activity indicators.

Manufacturing growth rose 6.0% YoY, with hi-tech manufacturing in particular continuing to outperform at 14.1%. With China's strategic direction focusing on industrial modernisation, this trend of hi-tech manufacturing outperformance is likely to continue.

Looking at the outperforming categories, it's clear that external demand is the key factor behind these categories, with rail, ships, and aerospace (18.2%), autos (8.7%, despite the sharp drop in domestic sales), and the computers, communications, and electronic equipment (15.7%) categories all comfortably outperforming headline growth. Semiconductor production hit a 17-month high of 25.4% YoY amid the continued tech boom.

In contrast, underperformers included categories which traditionally supported domestic property and infrastructure investment, such as cement (-5.6%), glass (-5.3%), and steel (0.0%).

Industrial production has been heavily external demand driven

Fixed asset investment growth continues to crater

Fixed asset investment dropped to -5.7% YoY ytd over the first half of the year, down from -4.1% YoY ytd in May. The reading significantly undershot market expectations (market: -5.0%, ING: -5.2%) and marked the lowest level since May 2020.

Private sector investment fell to -8.5% YoY ytd, worsening from a -7.1% decline over the first five months. State-owned investment also fell further into contractionary territory, down to -2.3% YoY ytd from -0.4% in the first five months. This sends a clear signal that public sector investment is no longer acting as a stabilising force after a decent start to the year. Against a backdrop of elevated global uncertainty, both private and state-owned enterprises appear to be postponing capital expenditure plans, adding to an already weak investment environment.

By industry, the divergence remains extreme. Sectors related to external demand and industrial upgrading continued to attract investment, including rail, ships, and aerospace (24.7%), textiles (9.4%), and computer and electronics manufacturing (6.5%). High-tech investment continued to grow at 4.6% YoY ytd. However, these bright spots were the exception. Manufacturing investment overall was soft at -1.2% YoY ytd, and would've looked even worse if not for strong investment in rail, ships, and aerospace at 24.7% YoY ytd. Infrastructure investment fell into negative territory, down to -2.4% YoY ytd, after managing positive growth over the first five months of the year. Many other categories, especially in the tertiary sector, saw double-digit year-on-year declines in investment.

The persistent lack of investment appetite continues to feed through to subdued credit demand, driving banks to park yet more funds in government bonds. Accelerating project approvals, special local government bonds, and more fiscal transfers look increasingly necessary to help stabilise the sharp deceleration of investment. The FAI data has been increasingly out of sync with the gross fixed capital formation data and overall GDP. It's worth watching to see if this is again the case when the detailed data is released in the coming days.

Broad spread weakness of investment raises pressure for increased fiscal support

Mixed signals in the 70-city property price data

China's National Bureau of Statistics released its 70-city sample of property prices for June. New home prices fell by -0.15% month-on-month, while used home prices dipped by -0.32%. This was a mixed bag: the new home price decline was the smallest monthly drop since April 2025, while used home prices saw the steepest decline in the past 4 months.

The city-level breakdown showed that 21 of 70 cities saw new home prices stabilise or pick up in June, improving from the 18 in May. However, only 10 of 70 cities saw secondary market prices pick up in June, down from 13 in May. We have argued that secondary market prices are more important, given the impact on household balance sheets.

The key silver lining is that tier 1 and 2 cities continued to show signs of stabilisation. Tier 1

cities Beijing, Shanghai, Shenzhen, Guangzhou all saw secondary market prices rise in June in a positive sign for household wealth. If we do end up confirming a trough, this could be a catalyst for gradual sentiment recovery.

Property investment, already down -18.0% YoY ytd, will remain a major drag on growth for some time, as inventories remain high and prices have yet to really confirm a bottom.

Property prices still seeking a trough even as tier 1 cities stabilise

Rising expectations for policy support to firm up second half growth

The sharp slowdown of growth will likely prompt policymakers to take a more proactive approach in the coming months. Markets have been looking ahead to the Politburo meeting later this month as a likely window to signal more policy support.

On the fiscal side, we expect modest fiscal easing, likely aimed at supporting consumption and accelerating existing approvals for local government special bond issuance and infrastructure projects. Central government bond issuance and fiscal transfers could be ramped up, but the scale might leave market participants underwhelmed. With growth still within range in 1H26, it's unlikely there is any sense of emergency that would warrant a bazooka-style stimulus package with massive fiscal expansion.

On the monetary side, low but positive inflation shouldn't impede further People's Bank of China easing if it is deemed necessary. Policymakers have made efforts to maintain ample liquidity, and we expect there is a solid chance we will see a rate cut within the quarter.

Overall, we expect China to be able to hit its full-year growth target of 4.5-5.0%. As things stand, risks to our 4.7% YoY full-year GDP forecast look balanced to the downside. It's uncertain how long it will take to announce and roll out policy support to arrest the downward

momentum. Without support, we're likely to see growth continue to grind lower. However, as we are in the first year of the 15th Five-Year period, it's likely that policymakers would prefer not to come in at the low end of this band, thereby raising the stakes for the upcoming Politburo meeting.

FX

FX Daily: Dollar upside risks are rising rapidly

Crude has jumped, but still isn't fully pricing in a fully-fledged new supply shock, meaning short-term risks remain on the upside for the dollar. So far, the rate differential is keeping EUR/USD afloat thanks to hawkish repricing of ECB expectations alongside the Fed's, but further energy price increases should overcome rates as a primary driver

We have published our monthly update of FX views and forecasts: [FX Talking – Dancing in the dark](#)

↑ USD: Room to rally

Short-term momentum is swinging back in favour of the dollar as the FX market is finally starting to take the Gulf re-escalation more seriously. Still, both oil (Brent is at \$84/bl this morning) and the USD are showing reluctance to fully price back in another supply shock. That's despite the US reimposing a blockade in the Strait of Hormuz and oil inventories at worryingly low levels. Overall US crude inventories (commercial+SPR) were 730.8m barrels as of 3 July, the lowest since 1984.

This positive but contained USD reaction does seem a déjà vu of this spring. But conditions are

different now. Reduced Fed guidance after a hawkish shift in June means allowing markets to speculate more aggressively on Fed tightening. Markets are now pricing in a roughly 50% chance of a hike in July, and 43bp by year-end.

Fedspeak remains crucial at this stage: yesterday, Chris Waller warned a hike may be needed in the short term if core inflation stays hot. Chair Kevin Warsh starts his first House testimony today, but he may follow his low-guidance approach and give little away. Barr, Goolsbee, Cook and Bowman are all speaking today.

Today's US June CPI release shouldn't severely dent markets' hawkish tendency. Headline should fall month-on-month due to lower energy prices, but core at 0.2% MoM isn't enough to dispel concerns about second-round effects.

Our call for the remainder of the year remains USD negative, primarily resting on another de-escalation and dovish Fed view. But risks, especially in the near-term, are clearly shifting to the bullish side for the greenback, with 102.0 potentially being reached rapidly in DXY if the Hormuz blockade continues.

Francesco Pesole

↓ **EUR: Helped by rates**

The EUR:USD short-term rate differential is – for now – helping to keep EUR/USD afloat in this Gulf re-escalation. The two-year swap rate gap has re-tightened around 15bp since the start of July, primarily because the rebound in oil prices happened at a time when ECB hike bets were dwindling, leaving more upside room to recover for EUR front-end rates.

We aren't convinced this rate gap can offer sustainable support to EUR/USD if energy prices continue to rise though. Markets may find it harder to price in more than two ECB hikes by year-end (now, 46bp) considering the less hawkish stance by ECB officials of late, and the medium-term negative implications of an energy crisis – combined with Fed tightening – for the EUR, tend to outweigh the positive of EUR hikes. The spike in gas prices is particularly concerning, as it weighs on the eurozone's terms of trade more than oil.

In a scenario where Brent returns to \$90-100/bl and TTF around €55-60/MWh, a move to 1.10 becomes a tangible risk in EUR/USD.

Francesco Pesole

↓ **NZD: Best performer in Gulf re-escalation**

The Kiwi dollar is the best-performing currency in the G10 since the start of this week, riding the wave of last week's hawkish repricing after an RBNZ rate hike. It's a testament to how the FX market is very keen to reward currencies that can offer flexibility on the hawkish side for

domestic central bank pricing, not just the positive commodity exposure (like for CAD, NOK, AUD).

Still, markets are now pricing in 60bp of tightening by year-end in New Zealand, which looks a bit too aggressive before seeing 2Q CPI, which is released on 20 July. AUD should recover some ground over NZD should this escalation fail to defuse.

Francesco Pesole

📉 CEE: Risk-off puts zloty and forint on the back foot

Regional currencies, along with the broader EM space, came under pressure yesterday following weekend headlines on the escalation of the US-Iran conflict. Risk-off sentiment and a stronger US dollar lifted EUR/PLN and EUR/HUF, while EUR/CZK stayed broadly stable. Hawkish CNB rhetoric should continue to cap EUR/CZK upside, leaving the koruna as the most resilient CEE currency. EUR/HUF is again approaching the 360 mark after two days of relief, a level that may act as resistance for many market participants. With our view of EUR/HUF in the range of 350-360 for the rest of the year, further upside should be limited.

By contrast, we still see EUR/PLN as vulnerable to further upside. From a rates perspective, despite yesterday's PLN sell-off, the rate differential versus the euro is broadly unchanged and still points in our models to levels around 4.340. If markets were to price in the full rate cut expected this year, it would open the door to a move above that level. Today's regional calendar is light, with only Czech May current account data due.
