FX RATES UNITED STATES

Why we've changed our Fed and ECB calls

After hawkish decisions this month, we now expect a rate hike from both the European Central Bank and Federal Reserve in December. We now also expect the US 10-year yield to end the year above 5%

Fed Chair Kevin Warsh and ECB President Christine Lagarde. We now expect rate hikes from both central banks in December

We've updated our central bank views

As central bank watchers, we know that predicting what central banks will do is not always the same as what they should do. Wednesday's Fed meeting and last week's ECB meeting have shown us that both central banks are not likely to follow the very dovish path we anticipated. This is why we have changed our calls for the Fed and the ECB, now expecting them both to hike rates one more time before year-end.

In the past, students of monetary policy learnt that it is almost always the Fed leading new cycles of monetary easing or tightening. As a good rule of thumb, Europe, whether via the ECB or, previously, the Bundesbank, would typically follow three to six months later. Perhaps we can blame globalisation, more integrated economies and financial markets or simply the same exogenous shocks, but whatever the reason, this time around presents one of those rare occasions when the ECB is actually leading the Fed.

For the next few months, both central banks seem set to move in tandem. This comes as no surprise, given that both central banks are facing the same dilemma: a supply-side shock

driven by surging energy prices that has so far produced only limited knock-on effects across the broader economy, set against still-fresh memories of the 2022 inflation surge and delayed central bank responses. At the same time, both the US and eurozone economies show an almost unexpected resilience, though to different degrees.

The much longer-lasting war in the Middle East has not only pushed energy prices to new highs, but also increased the risk that inflation could spread more broadly in the economy. This is why we now expect the Fed and the ECB to hike once more, in order to prevent these knock-on effects from materialising.

If energy prices remain higher for even longer, i.e., into 2027, and/or these knock-on effects materialise faster, both central banks could be forced to hike further. However, this is not our base case scenario, even after our forecast revisions. Our more dovish take, based on a reopening of the Strait of Hormuz before year-end and the fact that firms will not be able to pass through higher costs to consumers, still holds.

Our updated central bank forecasts

	Spot (18 Sep)	3Q26F	4Q26F	1Q27F	2Q27F	3Q27F	4Q27F	1Q28F	2Q28F	3Q28F	4Q28F

Our new Fed call: One more hike

We had switched to expecting a September Fed rate hike in the wake of Chair Kevin Warsh's hawkish Jackson Hole address, but characterised it as a likely one-off recalibration move akin to the single hike delivered by Alan Greenspan's Fed in 1997. However, the fact that only two FOMC members believe the central bank won't hike again this year suggests a broader hawkish repositioning has already occurred within the committee.

This has not been driven by economic data. The low-hire, low-fire labour market is keeping a lid on wage growth, which in turn should limit the scope for second-round price effects from higher energy costs. Meanwhile, tariff-related cost increases have largely worked through, with IEEPA tariff refunds providing a cash flow boost to corporate America. The largest component of inflation, shelter, is also looking less threatening, with the stagnant property market contributing to cooling housing rent metrics. We also remain sceptical of so-called "chipflation" given the small weighting within the inflation basket for impacted categories of goods and the

fact the US uses hedonic pricing, which incorporates quality improvements into price calculations.

Instead, it appears the Fed is increasingly focused on accelerating the pace at which inflation converges on the 2% target, fearing the protracted conflict in the Middle East will keep energy-impacted components elevated for longer and risk broader cost increases if left unchecked. We now expect this to mean at least one more rate rise.

In terms of timing, there are two more meetings this year. The first is 28 October, but we only have one round of jobs and inflation data between now and then; the proximity to the mid-term elections on 3 November could also prove a complicating factor. Unless the September jobs numbers and inflation data are very hot – which would leave little choice on a hike – we suspect the Fed would prefer to wait until 9 December.

Only 4 of 18 FOMC members anticipate the need for two hikes this year, but eight do expect a second hike next year. That is going to be contingent on the energy story. Our assumption of a Middle East de-escalation, improved energy flows, and lower prices over the next six months would likely mean an additional hike would not be needed – and as such, we forecast a peak of 4.25% followed by a prolonged pause.

Economic growth remains resilient, but the hefty upward moves at the long end of the yield curve will act as a brake on economic activity in an environment where real household disposable incomes have flatlined for 18 months. There are already signs of consumer stress in the form of low savings rates and rising credit card and auto loan delinquencies to levels last seen during the Global Financial Crisis. The lack of business capex growth outside of the tech sector also underscores the concentration risk within the US economy right now. As a result, we tentatively suggest we could start to see the Fed reversing course again from late 2027, particularly if energy prices are experiencing significant falls by then.

Our new ECB call: A December rate hike

Last week's ECB was not outright hawkish but more subdued and subtle hawkish. Christine Lagarde's downplaying of the concept of neutral interest rates can be seen as a way to prepare the grounds for further hikes. The fact that the staff projections see headline inflation only dropping below 2% in Q4 2027, while at the same time core inflation is expected to increase slightly were also hidden hawkish messages. At the same time, though, there are currently no signs of knock-on effects from higher energy prices. The risk is high that the ECB's own models are not fully capturing structural shifts and are overestimating the broadening of inflation in the economy.

Still, oil prices above 100 USD/bbl and the ECB still regretting its too late response to the inflation shock in 2022 are likely to push the ECB towards another rate hike before year-end. A hike that would still fall in the category 'insurance rate hike', with an increasing risk that

unwarranted damage to the economy could be done.

Looking beyond the next hike, we still think that market expectations of at least two more hikes in 2027 are overdone. It won't take a lot to undermine the picture of eurozone resilience. A picture that is too obvious also painted in the last ECB projections. GDP growth estimates of 0.3% to 0.4% quarter-on-quarter throughout 2027 and 2028 look highly optimistic. We wonder whether there shouldn't be more of an adverse effect on growth from higher oil prices and higher interest rates. Already next week's sentiment indicators (PMIs and Ifo) could change the picture of unbreakable resilience.

As long as there is only very limited spreading of the energy price shock to the rest of the economy, there is very little reason for the ECB to continue hiking next year. Every additional rate hike increases the risk of an unwarranted slowdown of the economy. If we are right and oil prices come down towards the end of this year and knock-effects from higher energy prices remain limited, we don't see additional rate hikes in 2027. If we are wrong, the story could clearly change.

Our Bank of England call: A hold in November (just)

We're sticking to our Bank of England call, which is that rates stay on hold into 2027. But this is entirely contingent on energy prices coming lower.

The Bank is still visibly reluctant to hike rates, partly because there's no sign of second-round effects, and partly because rates are more obviously restrictive than in other economies – particularly with the degree of tightening priced into financial markets.

But at its September meeting, the Bank made it abundantly clear that it's getting harder not to act. It has indicated that at current energy prices, inflation is likely to narrowly top 4% early next year, if only briefly. And the Bank has said previously that 4%+ inflation is statistically more likely to trigger a wider and more persistent price shock.

If that forecast is maintained at the November meeting because energy prices have failed to come down, then we would expect a BoE rate hike. In that scenario, we'd expect a follow-up hike in the spring.

That 4% inflation forecast is not inevitable. A lot of it rests on the uprating of the regulated energy price cap in January, which in turn depends on average natural gas prices over an 'observation window' between mid-August and mid-November. If nothing changes, we're looking at a 25% increase in energy bills at the start of 2027, but we're only a third of the way through that window. A fall in gas prices would temper that increase and therefore the overall peak in headline inflation.

Given our call for natural gas and oil prices to move lower through 4Q, we think our existing call for the Bank of England to keep rates on hold into 2027 is still valid for now. We are, however,

pushing back our forecast for the first rate cut to 3Q next year.

Rates: Direction to come from US Treasuries (10yr from sub-5% to 5.25% to 4.5%)

We've nudged higher anticipated end-year 10yr bond yield forecasts. It's a subtle move, but significant in the sense that it brings into play some key levels. In the US, the key number for the 10yr is now 5.1% at year-end, while for the eurozone we're in the 3.5% area for long-tenor rates. These levels are not wildly different from where we are now, but importantly, leave open the risk that some overshooting can occur in the intermediate period. That's a particular theme for the US 10yr where we've already closed above 5% twice in recent days. We're back below now, but we identify ongoing upside pressure for US long rates as a theme in the coming months. The eurozone has tended to share such moves, and will maintain a tendency to do so. Japanese long rates too should remain under pressure, and the same obtains for long-dated UK Gilts.

Front ends have been pricing in sequences of rate hikes for some time now, across all four major central banks. Specifically, so-called "carry spreads" (official rates to the 2yr) in the 75bp to 100bp range signalled market readiness for the delivery of a "few" hikes by central banks, without specificity on timing. This remains the case, with carry spreads of 65bp, 75bp, 90bp and 95bp for the ECB, Fed, BoE, and BoJ respectively. Think of neutrality at around 30bp, and anything above that as an implied market rate hike discount. The actual delivery of rate hikes is important, as it validates the prior evolution of carry spreads and, in turn, acts as a calming influence for long-end rates. We saw some of that play out as the Fed hiked by 25bp and intimated more. It helped calm long-end inflation expectations and take the US 10yr yield back below 5%.

However, even if inflation expectations have nudged lower, there are other pressures that long ends need to contend with. The first is issuance pressure, or more pertinently, the medium-term issuance narrative stemming from fiscal largesse; we can throw in long-duration hyperscaler issuance as a contributing factor, too. That's the "bad". Then there's the "ugly", in the guise of ongoing energy price pressure stemming from the Iran war. And there is the "good". Higher real rates have been an important driver, and a part of this likely incorporates AI-driven productivity growth. If that last bit was the central driver, we'd have little to worry about. But it's the other, more sinister factors that have predominantly sparked long-end market jitters. There's no doubt that central bank rate hikes help calm such jitters – but they do not make them disappear.

It took some time, but markets have finally developed a laser focus on deteriorating debt dynamics and medium-term financing concerns, particularly in the US. It's not impossible that we get through the coming months without another significant move higher in long-end yields. However, the balance of probabilities suggests there is at least one more leg of long-

end weakness still to play out. In an extreme scenario, this could take US 10-year yields into the 5.25% to 5.5% range. Other markets would likely move in tandem, mapping out similar, albeit less dramatic, blow-outs. Thereafter, we would expect a period of calm, particularly through 2027, as inflation ultimately heads lower. But first, we need to get through 2026.

FX: Short-term downside risk, but EUR/USD profile unchanged

EUR/USD currently has three primary drivers: short-term rate differentials, oil prices and global risk sentiment. Let's look at how these can change and impact the pair in the coming quarters based on our updated views.

1. **Short-term rates (neutral impact).** The EUR and USD swap rate curves look quite similar in their front-end segment – the most relevant one for the currency market. In both countries, rates are expected to be around 70-80bp above current levels at the end of 1H27. While we've revised our central bank calls higher, we remain firmly more dovish than those expectations. One hike each for the ECB and the Fed means similar dovish repricing in both curves in the next couple of quarters. The short-term rate impact on EUR/USD should therefore remain close to current levels into year-end and then gradually tighten throughout 2027. That implies an initially neutral and then gradually positive impact on EUR/USD.
2. **Oil prices (positive impact).** The premise of our dovish rate calls relative to the market is that oil prices will come lower and take the pressure off central banks. Our commodities team still targets an \$80/bbl average for 4Q26. While the oil-EUR/USD correlation can weaken in an energy price decline, it should support the pair on the margin.
3. **Risk sentiment (positive impact).** With the caveat that tech-related jitters can re-emerge at any time, the decline in short-term USD funding costs included in our forecast normally has a positive knock-on effect on FX liquidity and global market sentiment. Lower oil prices would also help in that direction. We expect a positive impact on EUR/USD in our baseline.

Taking all the above into account, we aren't changing our forecast for year-end in EUR/USD: 1.160 is fully in line with the scenario outlined for these drivers according to our calculations. However, risks are more skewed to the downside in the coming weeks.

We feel that the Fed's hawkishness has left EUR/USD more vulnerable, and 1.140 can certainly be tested, with risks extending to the 1.132 June lows if oil prices jump again and the Fed hikes rates in October. Looking at 2027, risks are also on the downside relative to our latest [forecasts](#), which included a move to 1.20 by year-end. That's due to the highest carry attached to USD after two more hikes. That said, if markets start to price in Fed cuts late next year, a broad-based dollar decline remains very possible.

CZECH REPUBLIC

CNB Minutes: Inflationary risks are starting to materialise

The Minutes strike a more hawkish tone than the press conference, highlighting a number of inflationary risks. Some of these risks are starting to become a reality. Ergo, we see a rate hike coming in November. More tightening may follow, depending in part on the Fed and ECB policy paths, as the energy shock persists

We believe the CNB will hike rates in November

Road paved with inflationary risks

The Bank Board assessed the balance of risks to price stability as tilted to the upside, with Governor Ales Michl stressing the need to maintain a hawkish stance. The current monetary policy setting was deemed adequate, with a strong koruna and elevated market rates helping the sufficiently tight setup. Core inflation is seen as too high, further driven by still-robust price dynamics in the service sector. Food prices are perceived as a significant risk to price stability, as the fundamental factors, along with the low comparison base, make renewed growth almost inevitable. Second round effects linked to the protracted oil price shock seem rather muted so far.

Nevertheless, Deputy Governor Eva Zamrazilova emphasised that the situation may change should the conflict become even more protracted. Strong global energy prices bring upward risks for electricity and natural gas prices for households. Wage growth remains relatively upbeat and above the level consistent with meeting the inflation target, despite the recent downward revision, as Jakub Seidler stressed, particularly in combination with weak productivity growth. Jan Prochazka noted that wages are continuing to recover lost purchasing power.

Real wages took a serious hit in the past

Source: CZSO, ING, Macrobond

Jan Frait does not see clear evidence of strong demand in the domestic economy, which he considers an argument for a cautious approach in terms of timing and the calibration of further policy responses. Jan Prochazka characterised the domestic economy as not overheating, while an acceleration of economic activity cannot be expected without a visible recovery in foreign demand. Still, the policymakers assess domestic demand as relatively resilient. Strong growth in lending to non-financial corporations is not yet seen as a clear sign of a credit boom. That said, according to Jan Frait, any further acceleration in overall credit growth would suggest that monetary conditions are not restrictive enough.

Rate rise is coming in November

We read the Minutes as more hawkish than last week's press conference, highlighting the pro-inflationary risks at every turn. There is a clear commitment to tighter monetary policy, if needed. The overall impression is that a higher base rate would be implemented without much hesitation, as the economy is deemed strong enough to withstand tighter conditions.

The situation has shifted, especially in terms of stronger oil prices, higher electricity and natural gas prices in Europe, and a weaker koruna. With all the identified pro-inflationary risks

starting to materialise, a 25bp rate increase at November's meeting is the likely outcome. At the same time, the economy's performance has moved into the spotlight, leading us to believe that any tightening will proceed with a degree of caution.

Hike, baby, hike

Source: Macrobond

The question is, how much tightening is needed to keep inflation in check at the relevant monetary policy horizon. Indeed, the impact of monetary adjustment needs time to work through the economy, with the full effect arriving with an approximate one-year lag. And with economic activity likely coming under pressure due to the protracted Hormuz conflict along with robust energy and basic materials prices, concerns over real economic activity and adverse impacts on household spending will gain traction. We expect the Czech National Bank to proceed step by step, with little appetite for sacrificing economic growth down the road. But sure, even more tightening after November's rate hike cannot be excluded given the course of global events.

Everyone is watching everyone else

A clear distinction between the short-term and the long-term, the transitory and the permanent, makes a lot of sense, as these fundamentally vary in their implications. At the same time, none of the monetary institutions operates in a vacuum, so the steps taken by the Federal Reserve and the European Central Bank clearly enter the reaction function of the Czech National Bank. And this consideration could gain prominence in a period of extended global turmoil, as a weaker exchange rate risks adding to imported inflation.

Negative real rates are a thing of the past, perhaps

Source: Macrobond

And here we observe some non-negligible differences among the crucial monetary institutions when it comes to their starting positions. This matters all the more as the global supply shock drags on, and the conflict evolves from a temporary disruption into a more permanent feature. The Fed and the CNB did not rush into rate reductions after the Covid-induced inflation wave, exacerbated by Russia attacking Ukraine. And here they stand with real interest rates still hovering above the zero bound. In contrast, the ECB's real interest rate has remained negative since March. Indeed, the eurozone's real interest rate drifted into what ancient mapmakers would have called *Hic sunt dracones* territory ("here be dragons").

Along with domestic price pressures, the CNB will consider the policy path of the Fed and the ECB more carefully in such a turbulent period, as a weak koruna would only add fuel to the fire of strong energy prices. On the other hand, businesses and households may start to crack under the pressure of high energy and borrowing costs at some point in the future. So what interest rate will be needed to steer the Czech economy through these rough waters? As always, the answer will reveal itself only gradually. But with both the Fed and the ECB either willing or compelled to raise rates further, additional tightening by the CNB cannot be ruled out.

CZECH REPUBLIC POLAND

CEE & CCA week ahead: Inflation data from Poland and Czech GDP

Poland and Kazakhstan will release inflation data next week, while the Czech Republic publishes second-quarter GDP details and September industrial PMI figures

We estimate that headline CPI in Poland rose above 4.0% YoY in September

Poland: Inflation set to rise above 4%

Wednesday brings the release of the September CPI flash estimate. The end of the temporary VAT cut on fuels (from 23% to 8%) in August, combined with higher crude oil prices in recent weeks, pushed fuel costs to fresh highs in September.

Meanwhile, food prices likely remained broadly stable, as the earlier sharp declines in vegetable prices appear to have run their course. Core inflation was probably little changed, but we estimate that headline CPI rose above 4.0% YoY, thereby moving clearly above the upper bound of the National Bank of Poland's inflation target tolerance range (2.5% +/-1 percentage point). This might support or even boost already high bets on rate hikes in Poland.

Czech Republic: GDP details and industrial PMI

The statistical office is expected to confirm the headline GDP figures for the second quarter on Wednesday, while the breakdown may be revised, as the contribution of changes in inventories may be absorbed into other expenditure categories. The main point of interest is whether household consumption remains strong or shows any signs of weakness. The

industrial PMI likely softened in September, on the back of the Hormuz conflict re-escalation that brought oil prices to new heights and increased uncertainty about future economic performance on the global scale.

CCA: Kazakhstan inflation expected to ease on base effects

CPI data for Kazakhstan will be released on Thursday. We expect monthly inflation to remain above its historical seasonal norm, continuing a pattern seen for much of this year. Rising external food price pressures, lingering pass-through from the VAT increase and continued growth in regulated domestic tariffs should keep monthly CPI elevated. However, the strong tenge and a more moderate fiscal stance should help contain inflationary pressures compared with last year.

As a result, we expect headline inflation to ease from 9.8% YoY in August to 9.5% in September, largely due to favourable base effects. Following the [NBK's front-loaded rate cut to 16.25% in September](#), we do not expect this moderation alone to provide a strong signal for additional easing before year-end, especially given persistent external inflation risks and uncertainty surrounding global commodity prices.

Key events in CEE & CCA next week

Country	Time (BST)	Data/event	ING	
Tuesday 29 September				
Turkey	1200	Aug Bank NPL Ratio	-	2.86
Wednesday 30 September

UNITED STATES

THINK Ahead: US jobs report and eurozone inflation data

Next week's US jobs report will be closely watched for signals on the Fed's October rate decision, while eurozone inflation data will provide an update on underlying price pressures

We expect September's US jobs report to show 100k jobs added

THINK Ahead in developed markets

United States (James Knightley)

- **Jobs Report** (Fri): Financial markets have moved to price an October Federal Reserve interest rate hike as being more likely than not. There are two key reports that will largely determine what the Fed decides to do, with the first – the September jobs report – due on Friday. The August report was much stronger than expected after a subdued run. Given that the low-hire, low-fire narrative remains in place, we expect a downward revision to that August number, with September coming in at around 100k jobs added. The unemployment rate is expected to hold at 4.1%. This outcome will keep an October rate hike in play. The next key data release will be September inflation, due on 14 October.

Eurozone (Bert Colijn)

- **Inflation (Fri):** Eurozone inflation continues to move mainly on energy prices at the moment. But with core inflation still at the same level as it was before the Middle East war started – 2.4% in both February and August – eyes will once again be on whether signs of second-round effects are kicking in.

FX AUSTRALIA

RBA preview: A decisive hike to keep inflation in check

The RBA is likely to deliver a hawkish 25bp hike on 29 September as persistent inflation pressures, resilient labour demand and higher energy costs strengthen the case for keeping policy restrictive. That should offer some support for AUD, which is suffering from a deterioration in the external environment but still offers solid fundamentals

Governor of the Reserve Bank of Australia, Michele Bullock. We expect a 25bp hike next Tuesday to offer some support for the AUD

The RBA is set to lean hawkish

We expect the Reserve Bank of Australia to deliver a decisive 25bp rate hike in the cash rate to 4.6% on 29 September, reflecting an economy that continues to run hot across multiple fronts. Labour market conditions remain tight, second-quarter GDP growth surprised to the upside, and recent inflation readings have come in stronger than expected. While the housing market has shown signs of cooling, we expect the RBA to emphasise that inflation risks remain tilted to the upside and that further vigilance is required to ensure price pressures return sustainably to target.

Core inflation is turning out to be stickier

What has strengthened the case for a hike

1. **Inflation risks remain tilted to the upside** following the escalation in the US-Iran conflict. While Australia is a major exporter of LNG and thermal coal, it remains heavily reliant on imported oil products such as diesel, petrol and jet fuel. Higher global oil prices have already lifted domestic fuel costs, raising input costs across transport, mining and agriculture and adding to food price pressures. The RBA estimates that a 10% increase in fuel prices could add more than 0.3ppt to headline inflation over one to two quarters, with indirect effects from production and transport costs contributing a further 0.2-0.25ppt. Even if crude oil prices moderate as we expect, domestic fuel prices are likely to remain relatively sticky, keeping inflation risks skewed to the upside.
2. **Trimmed mean inflation remains stubbornly high**, likely holding at 3.6% year-on-year in August for a third consecutive month. This suggests core inflation accelerated in 3Q rather than eased, challenging the RBA's expectation that trimmed mean inflation would slow to 3.3% by year-end. With renewed supply-side disruptions and higher fuel and food prices, the path back to target appears increasingly difficult.
3. **Labour demand remains strong**. Despite the rise in the unemployment rate to 4.6%, labour market conditions remain tight. Full-time employment growth strengthened in both July and August, while three-month average job creation accelerated to 34k, the strongest pace since the onset of the US-Iran conflict in February. The participation rate also rose to a record-high 67.1%, suggesting labour supply is increasing but is still being absorbed by robust hiring demand. The combination of strong employment growth and elevated participation points to continued labour market resilience and raises the risk that wage and underlying inflation pressures remain persistent.

Labour market remains resilient

RBA to help AUD weather turmoil

The Australian dollar has had a rough week, hit by poor risk sentiment and the global bond selloff. Our short-term fair value model (chart below) indicates AUD/USD is now undervalued beyond the 1.5 standard deviation band, suggesting a higher bar for further depreciation.

AUD/USD decline looks overdone

Clearly, the USD leg of the story is the big question mark. An October hike by the Federal Reserve could keep USD well in demand and delay any AUD/USD recovery further. But if we are right in expecting the next Fed hike only in December, we think AUD can top the G10 scorecard in a USD correction.

That's because AUD fundamentals remain strong and should improve further with a

September rate hike by the RBA. Incidentally, there is less room for a dovish repricing in the AUD curve compared to the USD curve. Markets are pricing in 22bp for the RBA next week, and another 40bp after that, spread over the next nine months. The Fed funds futures curve currently embeds 90bp by July 2027. As we currently forecast only one hike by both the RBA (next week) and the Fed (December), the rate differential should turn more positive for AUD/USD.

We are revising our year-end target for AUD/USD from 0.73 to 0.72. In the very near term, a test of sub-0.700 levels is the risk, but we think an RBA hike can prevent a retest of the roughly 0.690 June lows.

ASIA WEEK AHEAD AUSTRALIA CHINA

Asia week ahead: RBA decision, key data on China, Japan, Korea, Indonesia

The Reserve Bank of Australia is expected to raise interest rates by 25bp, while investors will also be closely watching China's PMI data, activity and inflation readings from Japan and South Korea, and Indonesia's latest CPI report

Asia Research highlights of the week

[Xi-Trump summit: Pandas and positive vibes but limited progress](#)

[Bank Indonesia holds, but the hiking cycle may not be over](#)

[Oil, not El Niño, is driving Singapore inflation](#)

Australia: RBA expected to hike rates by 25bp

We expect the Reserve Bank of Australia RBA to deliver a decisive 25bp rate hike on Tuesday, reflecting an economy that continues to run hot across multiple fronts. Labour market

conditions remain tight, second-quarter GDP growth surprised to the upside, and recent inflation readings came in stronger than expected. While the housing market shows signs of cooling, we expect the RBA to emphasise that risks remain tilted to the upside and further vigilance is required to ensure prices return sustainably to target.

Separately, August CPI data is likely to accelerate further to 4.1% year-on-year, driven primarily by higher diesel and food prices, alongside persistent underlying core inflation pressures.

China: PMIs expected to slow a modest recovery

China releases September purchasing managers' index data on Wednesday. We look for the National Bureau of Statistics to report a slight recovery in its official manufacturing and non-manufacturing PMIs to 50.1 and 49.2, respectively. The RatingDog PMI, which has generally outperformed lately because of its more export-oriented sample, is out the same day. Industrial profits data is out Monday. Growth in the series has been moderating over the past 3 months, even as overall profits have improved from previous years.

Japan: Activity and inflation data in focus

Japan releases its August services PPI on Monday. Market consensus is for services inflation to remain unchanged at 3.6% YoY, indicating that price pressures in the sector remain firm. Retail sales growth is expected to moderate to 3.2% YoY, from 4.0% in July. Sales are forecast to decline 0.9% month-on-month after the previous month's 2.4% increase. Industrial production is expected to rebound 1.4% MoM, lifting annual growth to 7.0% YoY from 3.9%. The quarterly Tankan survey is expected to show improvement in business sentiment among large manufacturers. The index is expected to rise to 25 from 22, while the outlook is seen rising to 22 from 17.

Tokyo inflation data will be released on Friday. Market consensus is for headline inflation to accelerate to 2.5% YoY, from 1.9%, while core prices rise to 2.4%, from 1.8%. This pickup would suggest that price pressures remain elevated.

South Korea: Trade surplus to widen as inflation eases

South Korea releases August industrial production data on Wednesday. Market consensus expects industrial production growth to accelerate to 4.5% YoY, from 3.6% in July. Monthly output is forecast to rise 0.5%. September trade data, out Thursday, is expected to show a moderation in both export and import growth to 61.2% YoY and 20.7% YoY, respectively. Despite slower growth, the trade surplus is forecast to widen to \$38.4bn, supported by continued strength in technology and semiconductor exports. Headline CPI inflation is expected to ease to 3.0% YoY in September, from 3.1% in August. Core inflation is forecast to slow more sharply to 2.8% YoY, from 3.4%.

Indonesia: Inflation set to accelerate on food pressures

We expect Indonesia's CPI inflation to accelerate to 3.3% YoY, as El Niño drives further increases in food prices. Rising rice prices should remain a key driver, while spillovers from higher food costs are also likely to add to core inflation.

FX

FX Daily: Bond sell-off helps USD consolidate gains

The rise in back-end yields has prompted a risk-off environment that favours a consolidation of recent dollar gains. Markets remain reluctant to price in any optimism into oil prices, which keeps risks on the upside for rates. EUR/USD may still have some room to fall before recovering

The dollar is benefiting from the knock-on effects of the bond sell-off on global risk sentiment

➔ USD: Keeping an eye on the back-end

The global bond sell-off continues to leave its mark on FX. The dollar is benefiting from the knock-on effect on global risk sentiment, allowing a consolidation of recent gains even as they start to look stretched relative to short-term fundamentals. Oil prices remain bid after the UN summit failed to generate tangible optimism about a resolution in the Gulf.

Reports that the US and Iran are discussing a phased deal to reopen the Strait of Hormuz prompted a correction in oil, but losses were fully recouped within a couple of hours, underlining growing scepticism about any imminent de-escalation. It is a dynamic that argues against any material rebound in bonds for now.

By extension, we remain cautious about calling the end of this USD rally. We may see \$110/bbl for Brent before the end of the month, with the dollar finding fresh support from the energy story, especially in an environment where the Fed's hawkish remarks are allowing markets to price in more rate hikes. A testament to that is the 2-year SOFR, which is up almost 20bp over

the past 48 hours. Pricing for October has now reached 18bp, with two hikes fully priced in by January and almost four by July 2027.

Francesco Pesole

➔ **EUR: France a rising concern**

We still view the 1.1320-1.1330 area as the next key support for EUR/USD. We could reach that level quite quickly if oil prices take another sharp leg higher and/or US data surprises to the upside over the next couple of weeks. For now, we do not think new lows are imminent, but downside risks persist.

As for euro-specific drivers, economic resilience ([yesterday's Ifo index](#) mirrored strong PMIs) is at least partly being offset as a EUR-positive factor by wider eurozone spreads. French 10-year yields are trading 110bp above bunds, and there has been little relief from reports that Marine Le Pen may back the proposed budget to avert a bond crisis.

We analysed France's fiscal issues [in this note](#). Risks are tilted towards further spread widening from here, and while the FX impact remains difficult to isolate, it is a narrative that is unlikely to help the euro in the current environment.

Francesco Pesole

➔ **CHF: SNB leaves hawks disappointed**

The Swiss National Bank held rates unchanged as expected but surprised markets on the dovish side yesterday. Despite the upward revision to its inflation projections, policymakers signalled no concerns about second-round effects, with the price shock still viewed as temporary.

The SNB slightly tweaked its currency stance, removing the reference to an "increased willingness" to intervene while retaining its commitment to act when necessary. While this grabbed headlines, it is merely an adjustment reflecting the franc's recent weakness and does not imply any reluctance to intervene again should the currency appreciate.

Market pricing remains too hawkish in our view, and that is what matters most for the Swiss franc. A hike is already fully priced in by March, but we still see few reasons to tighten policy in the foreseeable future. We think downside risks remain for the franc, with EUR/CHF potentially retesting the 0.9480 highs seen earlier in September. USD/CHF is probably where the upside potential is even greater at this point: an October hike from the Federal Reserve could prompt a rally to 0.85 in the near term.

Francesco Pesole

📌 CEE: Energy shock pushes tightening bets to new highs

Regional markets remain under pressure as volatility in core rates and energy prices amplifies moves in CEE rates. At the peak, markets priced in an average of 15bp of additional tightening across the region. Despite a partial correction, rates remain elevated, leaving roughly 125bp of tightening priced in for both Poland and the Czech Republic. High oil and gas prices at yesterday's close, alongside fresh highs in 10-year US Treasury yields, point to continued stress today. Although the backdrop is not directly comparable with the 2022 energy shock, the market response is beginning to look similar. With peak tightening expectations in 2022 reaching 210bp in Poland and 165bp in the Czech Republic, further repricing cannot be ruled out if energy prices continue to rise, regardless of central bank rhetoric.

Yesterday, regional FX found support from improving rate differentials, reversing the narrowing trend in place since early September. This should help to stabilise currencies a bit. However, EUR/USD continues to test new lows and energy prices remain on the rise. Despite headlines suggesting possible US-Iran negotiations, we retain a bearish view on regional FX.

RATES SPARK

Rates Spark: US 10yr continues to target 5.25%+

The overshoot to the 5.25%-5.5% area for the US 10yr yield is ongoing. The front end paused after valuations looked stretched, but resilient macro data, elevated energy prices and inflation pressures generally continue to pressure yields higher

Bearish sentiment continues for long-end bonds

The rate hike discount looks extreme, but long bond yields can remain under pressure

The US 7yr auction tailed moderately. Not as horrendous as the previous day's 5yr auction, which tailed by a substantial 3bp. That auction was the last straw on Wednesday, prompting a follow-through rise in the 10yr yield to over 5.1%. Fast-forward to Thursday, and we're suddenly knocking on the door of 5.2%. And the driver? Predominantly it's higher real yields, as it has been for a number of months now. Which is important, as this is not shielded by the Fed hiking rates, which could be the case if we had an inflation expectations issue. We have a printed inflation problem in the rear-view mirror, but inflation expectations in fact remain relatively contained.

Ahead, we think that there are enough rate hike fears discounted at this juncture, and certainly enough to take care of perceived inflation risks. But, government bond yields are primed to remain under pressure on a pure debt dynamic theory, which translates into pressure for some re-widening in swap spreads, and especially in the 10yr area. So far,

Treasury Secretary Bessent's buyback programme has in fact been successful in the sense that it was followed up by tighter swap spreads.

Thursday saw US\$4.1bn bought back in the latest reverse auction, but we're not of the opinion that the market should be overly concerned with this, in the sense that it's not a negative. It's still a moderate positive for the long end, as the Treasury is doing at least double what they did. We get there is disappointment that it has not been more. But that was never intimated by the Treasury Secretary in the first place, in our opinion. The Treasury Secretary, in fact, should be pleased that swap spreads remain relatively contained, so far at least.

The bearish narrative remains intact with none of the key drivers behind the recent sell-off is showing signs of fading

None of the drivers that brought us the increase in rates are going away. The front end has taken a small breather after valuations started to look stretched, even as oil continued to climb. For the European Central Bank, a full 100bp priced in over the next year does appear ambitious, given that there is still a lot of uncertainty around the outlook. But ECB chief economist Lane basically confirmed on Thursday that the ECB sees itself confronted with the adverse energy market scenario while, at the same time, all data points to ongoing macro resilience.

Long-end rates remain more exposed to upward pressures, with the Bund probing towards 3.6%. That also means limited relief for spreads, with 10y French OATs still yielding 109bp above Bunds. Keep in mind that the 'positives' for France from better data are also limited, with the latest business climate indicator falling. Indeed, the overall strong PMIs masked an unexpected decline in the French manufacturing index. Regarding the broader sentiment, the weakness in equities seems more a mechanical reaction to the rise in rates rather than a genuine risk-off move at this stage. The VIX equity fear gauge stands close to the low end of this year's range.

However, after Wednesday's level-shift higher in rates, the next big moves are more likely to come next week as it features several important data releases. The underlying tenor should not stand in the way of the bearish sentiment.

In the eurozone, the flash CPI releases start on Tuesday with reports from Spain, followed by France, Germany and Italy on Wednesday, and will be scanned for confirmation of the expected rise in both headline and core inflation rates before the eurozone-wide estimate.

It is also a big week ahead for US data, with the official jobs market data for September at the end of the week. At the time of writing, the consensus is pencilled in at a solid 104k increase in non-farm payrolls. The PCE data for August will only confirm the elevated price pressures, as the inputs are largely known from other releases. We will also get the ISMs, which in the US are usually more closely watched than the S&P PMIs, but the market will be looking for

confirmation there too.

Friday's events and market view

In terms of eurozone data we will be looking at the German consumer confidence data and the ECB M3 data. The US will release durable goods orders for August and the final September reading of the University of Michigan consumer confidence index. It will be busier on the central bank speaker front. The Fed's Williams, Schmid and Hammack are scheduled for the day. The Bank of England's Bailey will also speak. From the ECB we have Vujcic.

After the markets close, the scheduled reviews from Moody's will be in focus: Italy (Baa2/Stable, the ESM and the EU (both Aaa/Stable) are on the agency's list for the day. S&P has Slovenia scheduled for a possible review (AA/Stable).

FX

FX Daily: Hawkish wave to hit Scandinavia today

We expect the Riksbank to deliver a hawkish hold, hinting at an imminent rate hike, which we expect in November. In Norway, we see a rate hike in a close decision. NOK faces greater upside than SEK as markets and consensus are more split regarding Norges Bank. Meanwhile, the dollar rally has accelerated, and the move is starting to look stretched

We expect the Riksbank to deliver a hawkish hold today

📉 USD: Rally starting to look stretched

The dollar jumped yesterday, with DXY breaking above 101.0. Very strong US PMIs, higher oil prices and soft risk sentiment have all contributed to the bullish narrative, although the move is starting to look stretched relative to fundamentals. We are cautious in calling for a bottom in the dollar just yet because any upside surprise in upcoming US data releases can easily prompt markets to fully price in an October Fed hike and prop up short-term rates even more. But if this risk doesn't materialise, we expect a correction in DXY in the coming weeks, with a return to the 100-100.5 area.

USD/JPY remains another source of potential downside risk for the dollar. The rapid rally in the

pair may draw Japanese authorities to intervene – remember last week's reported rate check – and that could easily spill over into a weaker USD across the board. Without any intervention, a return to above 160.0 levels looks inevitable after the dovish surprise by the Bank of Japan last week.

Today, focus will be on the summit between President Trump and Chinese leader Xi Jinping. There is a history of Trump striking a more conciliatory tone in face-to-face events, and Scott Bessent has already announced an extension of the trade truce by two months. We're not sure the dollar will respond much to positive US-China headlines at this stage, with any positive effect probably more visible in AUD and NZD. Those could emerge more prominently as proxies for CNY after the People's Bank of China set a weaker fixing for the yuan for the second consecutive day.

Fedspeak also remains firmly on investors' radar, with Williams, Barkin, Hammack and Paulson all due to deliver remarks today. The data calendar is quiet.

Francesco Pesole

↑ **EUR: Downside risks start to shrink**

The break below 1.140 in EUR/USD has sent the pair into stretched undervaluation territory according to our short-term fair value model. That's because short-term rate differentials actually moved in favour of the euro, offsetting the negative impact on fair value from lower equities and oil.

The move was entirely dollar-driven. [PMIs also surprised on the upside](#) in the eurozone, with services rising sharply, which marginally helped the euro in some crosses.

The lack of clear technical support in EUR/USD until the June lows, where intraday spot hit 1.1325-30, means catching the falling knife remains risky for now. However, we don't see the conditions for a break into new lows just yet unless the short-term rate differential widens in favour of USD. A 1.1430-1.1450 level would be more in line with the current environment. So we'd expect a convergence to that area ultimately.

Francesco Pesole

↑ **Scandies: A hawkish hold and a hike**

We expect SEK and NOK to outperform today thanks to a hawkish hold by the Riksbank and a 25bp rate hike by Norges Bank. NOK has more upside potential.

Markets and consensus are fully aligned in expecting no rate change by the Riksbank this morning. As discussed in our [preview](#), inflation has remained muted, even when adjusting for tax distortions. That argues against an urgent move just yet. However, the 2Q growth surprise

reduces the cost of delivering some insurance tightening, in our view, starting from the November meeting. Persistently high energy prices and SEK's weakening add to the pressure building from other central banks – especially the ECB and the Fed – that have started hiking already. We expect hints of imminent tightening and a revision higher in rate projections today.

SEK should get some help from it, but markets are already fully pricing in a November hike and another by February, meaning a decisive turn lower in EUR/SEK will still require lower oil prices and more stable risk sentiment. Upside risks into 11.35-11.40 remain in the near term, but our baseline is for a return to 11.0 by 1Q27.

In Norway (meeting preview [here](#)), inflation rebounded in August, but the underlying measure remained 0.3pp below Norges Bank's June projections. That makes it a close call today, and consensus is equally split between hike and hold. But a good growth outlook and pressure from other central banks' decisions can tilt the balance for a hike in our view. Market pricing is 16bp, allowing some room for NOK to rally from the hawkish surprise. Incidentally, markets are not pricing much more than one hike also into next year, meaning even a hawkish hold could not be dramatically negative for NOK. We think this is the last hike of the cycle anyway. We maintain a near-term EUR/NOK target of 10.70, but are looking at increasing downside risks into year-end.

Francesco Pesole

📉 CEE: Global headwinds keep regional FX under pressure

A new day brings a new direction for the markets. Market sentiment shifted again yesterday, and we saw a strong hawkish repricing across the region; rates across the region and along the curve returned to previous highs. Despite higher regional rates, we observe that rate differentials are actually narrowing or remaining stable. This is currently insufficient to stabilise FX, while the US dollar continues to rally. Coupled with a rebound in global energy prices, this creates an overall negative environment for CEE currencies.

We therefore maintain a bearish bias and anticipate further regional weakness, with the PLN likely to underperform in this environment given the central bank's dovish stance relative to its peers. Today's calendar is light, featuring only consumer confidence data from the Czech Republic – a figure unlikely to impact a market dominated by global narratives.

Article | 21 September 2026

RATES FRANCE

France's elusive €54bn fiscal fix

France's fiscal position is worse than expected, and the government has not yet presented a fully documented response. Debt will keep rising, while political fragmentation means that a credible long-term solution is unlikely to emerge soon

France's fiscal position continues to deteriorate and there appears to be no long-term solution

A much tougher starting point for 2027

France's fiscal outlook has deteriorated again. The government now expects the public deficit to reach 5.4% of GDP in 2026, up from the 4.6% objective set at the start of the budgetary process and the 5.1% recorded in 2025. Weaker activity plays an important role in the explanation. The government has cut its 2026 growth forecast from 1% to 0.5%, reducing tax revenues, while energy-related support measures and higher interest expenditure have increased public spending.

The starting point for the 2027 budget is even more challenging. According to the government, the deficit could reach 6.5% of GDP without new corrective measures, as ageing-related expenditure, indexed pensions and benefits, debt-servicing costs and other commitments continue to rise, while temporary tax measures expire or are reduced. The required adjustment has also increased substantially: debt-servicing costs alone are expected to rise by around €10bn in 2027. A growing share of any fiscal effort will therefore be needed to offset higher interest expenditure.

A €54bn ambition, but few details

Prime Minister Sébastien Lecornu has announced a budgetary effort of around €54bn to limit the deficit to 5% of GDP in 2027. However, this remains a political objective rather than an adopted or fully documented plan. The government has not explained in detail how the figure was calculated, although some measures are already known.

These include freezing central government expenditure in nominal terms outside defence, restraining local government spending, freezing the civil-service pay scale, limiting increases in some pensions and benefits, saving €2bn on sick leave and extending the temporary corporate tax surcharge at a lower rate. Net public expenditure is expected to rise by 0.7% in 2027, after 1.4% in 2026. Spending would therefore continue to increase, but its share of GDP would decline slightly from 57.1% to 56.9%, despite higher defence and debt-servicing costs.

The adjustment would also rely heavily on revenues. The tax-to-GDP ratio is expected to rise from 43.9% to 44.2%, despite the government's pledge of fiscal stability. No broad-based tax increase has been announced; income-tax brackets would remain indexed to inflation and the corporate surcharge would be reduced. The government expects €1bn from stronger action against fraud and plans to review some tax breaks, but it has not explained where the rest of the additional revenue would come from. The package therefore remains only partly documented.

The €54bn headline also carries a political message. It highlights to French MPs the cost of rejecting the budget or bringing down the government, while warning the next administration about the challenge it would inherit. But adoption is far from certain. Without a parliamentary majority, the government must either negotiate enough support or resort to Article 49.3, at the risk of a no-confidence motion. The 5% deficit target therefore remains an ambition rather than a secured outcome. What is beyond doubt is that France faces a very substantial fiscal adjustment.

Debt is still moving in the wrong direction

This deterioration comes amid an already high debt burden. Public debt reached €3.54tr, or 117.5% of GDP, in the first quarter of 2026, up from 115.7% at the end of 2025. The government expects it to rise further, to 119.3% in 2026 and 121.7% in 2027. Even if the deficit falls to 5% next year, the budget would only slow the deterioration, not stabilise the debt ratio.

This leaves France increasingly exposed to higher refinancing costs. The implicit interest rate on public debt has risen from 1.25% in 2020 to around 2% in 2025. The European Commission's May forecast put it at 2.3% in 2026 and 2.43% in 2027, but the subsequent increase in market yields suggests that the eventual cost could be higher. With average debt maturity at around eight-and-a-half years, the pass-through will be gradual but persistent.

France is drifting further from its European commitments

The new targets represent a substantial departure from France's European commitments. Under the previous fiscal path, the deficit was expected to fall to 4.6% of GDP in 2026, 4.1% in 2027 and 3.4% in 2028, before moving below the EU's 3% threshold in 2029. The new figures for 2026 and 2027 are respectively 0.8 and 0.9 percentage points higher. A deficit of 5% in 2027 would leave France with more than two percentage points of adjustment to deliver in just two years to return below 3% in 2029. Such an adjustment appears highly unlikely, meaning that the commitment no longer looks credible.

A lasting solution will have to wait

France is no longer dealing only with a cyclical budget miss. Lower growth has worsened the near-term figures, but structural spending pressures and a rising interest bill are also widening the deficit. Even if the full €54bn effort is delivered, the deficit would remain far above the European threshold and insufficient to stabilise the debt ratio.

A credible multi-year consolidation plan is unlikely to emerge soon. The presidential election will take place on 18 April and 2 May 2027 and is likely to be followed by parliamentary elections, but there is a high risk that no clear majority will emerge. In that case, even an administration committed to stabilising the debt would struggle to approve and implement the necessary measures.

A different risk is that the next administration may simply choose not to prioritise fiscal consolidation, as some candidates are focusing more on new spending or reallocating expenditure than on reducing the deficit. France's ability to address its debt problem will therefore depend both on the next government's fiscal priorities and on whether it can secure sufficient parliamentary support to implement them.

Charlotte de Montpellier

Bond spreads will remain under widening pressure for now

The widening dynamic of French government bond spreads versus Germany accelerated last week after the government's budget plans again highlighted the magnitude of the problem and the difficult political path ahead. The widely watched 10y benchmark spread topped 100bp, reaching highs not seen since 2012.

On Friday, the rating agency DBRS lowered the outlook on its AA rating for France to negative. The agency Scope downgraded France to A+/Stable and cited the deteriorating fiscal outlook. Moody's, with its rating still at Aa3/Negative, is due to review on 23 October and could be next to lower its rating. One can, of course, view this as catching up with Fitch and S&P, both of which already have France at A+. The stable outlooks for these single-A ratings can also

argue for some reprieve. But the latest actions highlight that patience might be wearing thin after political turmoil that has basically been ongoing since the summer of 2024.

Arguably, a lot of the political and fiscal risk is already priced into the spread. 10y French bonds yield more than 10bp above their Italian counterpart, with debt metrics worse than France, lower ratings but arguably a less uncertain political landscape and a more domestic investor base that is deemed less volatile. Foregone carry also means positioning against France is also a costly affair.

But timelines don't play in favour of French government bonds – the 2027 budget now, the presidential election early next year, likely followed by parliamentary elections and then government formation. That means the positives for spread dynamics will likely have to come from somewhere else. Spreads have shown a greater correlation with oil prices as a gauge of geopolitical tensions. While we still eye an easing of tensions after the US mid-term elections, the Middle East conflict has already dragged on for longer than hoped.

One important backstop to the spread dynamics is the ECB and its Transmission Protection Mechanism (TPI). On paper, the conditionality of deploying TPI looks very strict, but we would argue the ECB has a lot of discretion when the broader market functioning is deemed at risk. However, the hurdle for the ECB to engage in bond purchases might be higher in the current situation where the central bank is focused on inflation and eyeing further tightening.

For now, we are looking at the widest spreads since the sovereign debt crisis of 2011/2013. French 10y spreads over German Bunds peaked just below 190bp back then, and it eventually took Draghi's famous "whatever it takes" in summer 2012 to turn the tide for good. We do not think we will head that far as the ECB precedent has been set. But without any positive developments in the Middle East and/or more encouraging headlines out of the political arena, the 10y spread could occupy a range of 100 to 125bp in the coming months.
