NOTES/DEFINITIONS

IMPORTANT NOTICE

This disclaimer is in addition to and not in replacement of any disclaimer of warranties and liabilities set forth in a written agreement between LSEG and you or the party authorizing your access to the Service ("Contract Disclaimer"). In the event of a conflict or inconsistency between this disclaimer and the Contract Disclaimer the terms of the Contract Disclaimer shall control.

By accessing these materials, you hereby agree to the following:

These research reports and the information contained therein is for your internal use only and redistribution of this information is expressly prohibited. These reports including the information and analysis, any opinion or recommendation is not intended for investment purposes and does not constitute investment advice or an offer, or an invitation to make an offer, to buy or sell any securities or any derivatives related to such securities.

LSEG does not warrant the accuracy of the reports for any particular purpose and expressly disclaims any warranties of merchantability or fitness for a particular purpose; nor does LSEG guarantee the accuracy, validity, timeliness or completeness of any information or data included in these reports for any particular purpose. LSEG is under no obligation to provide you with any current or corrected information. Neither LSEG nor any of its affiliates, directors, officers or employees, will be liable or have any responsibility of any kind for any loss or damage (whether direct, indirect, consequential, or any other damages of any kind even if LSEG was advised of the possibility thereof) that you incur in connection with, relating to or arising out of these materials or the analysis, views, recommendations, opinions or information contained therein, or from any other cause relating to your access to, inability to access, or use of these materials, whether or not the circumstances giving rise to such cause may have been within the control of LSEG.

The information provided in these materials is not intended for distribution to, or use by, any person or entity in any jurisdiction or country where such distribution or use would be contrary to law or regulation or which would subject LSEG or its affiliates to any registration requirement within such jurisdiction or country.

DISCLAIMERS

The service does not constitute a recommendation to buy or sell securities of any kind and LSEG has not undertaken any liability or obligation relating to the purchase or sale of any securities for or by you.

The service is furnished to you on an "as is" basis with all faults and defects contained therein. LSEG does not make any representations or warranties either express or implied, including without limitation, any implied warranty of merchantability or fitness for a particular purpose or use, with respect to any aspect of the service. LSEG does not make any warranties that the service will be uninterrupted, timely, complete, and accurate or error free, or the results to be obtained from use of the service. Use of the service is at your sole risk and LSEG shall not have any responsibility or liability for any errors or omissions in, or resulting from the use of, the services or the software product, any decision made or action taken by you in reliance upon the services, any failures or delays in providing the service, any loss of use thereof, or for any loss, damage, injury or expense caused directly or indirectly by its actions or inactions in connection with this agreement or the production, distribution or redistribution of the service. LSEG will not in any way be liable to you or to any other entity for any indirect, consequential, punitive, special or exemplary damages, including, but not limited to, loss of profits, resulting there from, regardless of cause and regardless of whether or not LSEG was advised of the possibility of such damages.

JURISDICTION

These Terms and Conditions shall be construed and enforced in accordance with the law of the State of New York without giving effect to any choice of law or conflict of law provisions. In no event shall these Terms and Conditions be governed by the United Nations Convention on Contracts for the International Sale of Goods. UCITA, whether enacted in whole or in part by any state or applicable jurisdiction, regardless of how codified shall not apply to these Terms and Conditions and is hereby disclaimed. Any disputes arising under these Terms and Conditions will be brought and heard in the appropriate Federal or state court located in New York County in the State of New York and each of the parties hereby irrevocably consents to the jurisdiction of such courts.

You may not assign these Terms and Conditions nor any rights granted hereunder by sale, change in control or otherwise without LSEG' prior written consent.

About this document

This report details the performance of the StarMine Analyst Revisions Model (ARM), StarMine Earnings Quality Model (EQ), StarMine Intrinsic Valuation Model (IV), StarMine Relative Valuation Model (RV), StarMine Price Momentum Model (Price Mo),StarMine Valuation-Momentum Model (Val-Mo), StarMine Smart Holdings Model (SH), StarMine Short Interest Model (SI),StarMine Insider Filings Model, StarMine MarketPsych Media Sentiment (MMS) and StarMine Combined Alpha Model (CAM) for September and the trailing twelve months.

Executive Summary

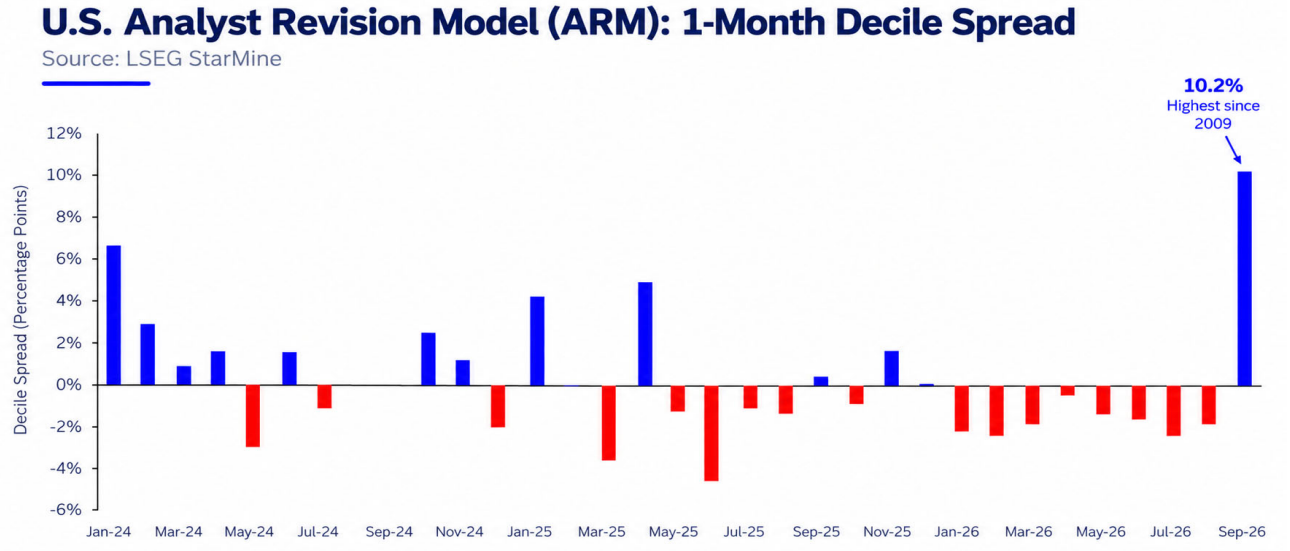

Market Performance

Performance was negative on an equal-weight basis across most markets. Brazil and Korea had the strongest performance with prices rising by 5.3% and 4.2%, respectively. U.S. saw prices fall by 3.9%.

Long-Short Performance

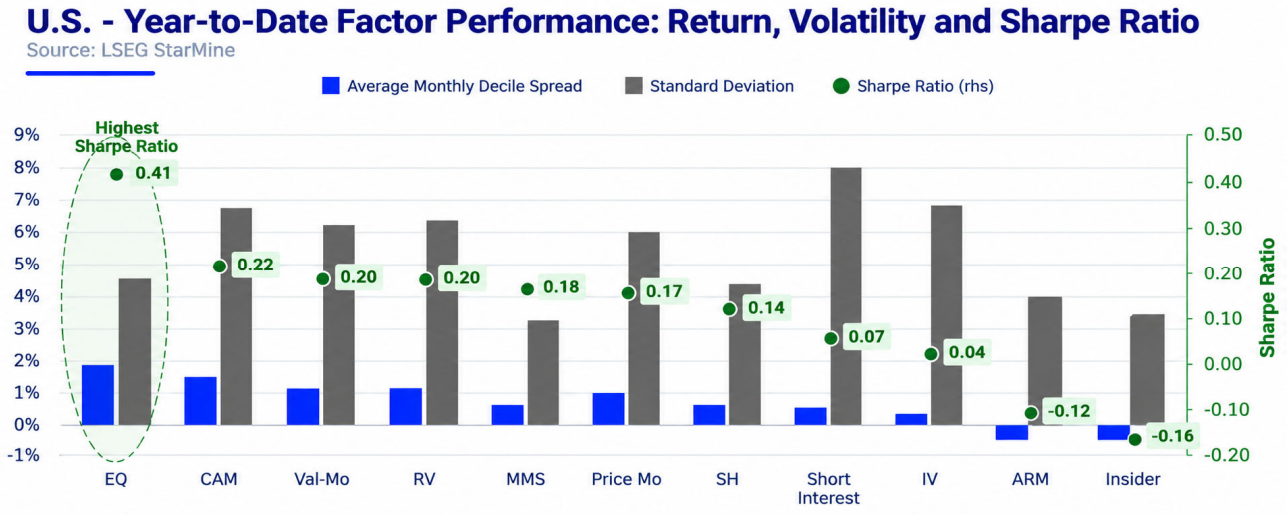

Analyst Revision Model (ARM) exhibited the broadest strength, with positive top-bottom decile spreads across all regions and countries, followed by Combined Alpha Model (CAM), Value-Momentum (Val-Mo), and Earnings Quality (EQ). Value factors including Relative Value (RV) and Intrinsic Value (IV) exhibited the weakest breadth.

In the U.S., ARM rebounded sharply, recording a decile spread of 10.2 percentage points, its highest since 2009. This was driven by top-decile performance in Semiconductors, while bottom-decile stocks declined, led by Health Care and Discretionary.

EQ also recorded its strongest monthly decile spread since 2022 in the U.S., driven primarily by gains from shorting bottom-decile stocks rather than top-decile performance. The bottom decile declined 9.2%, led by Health Care, followed by Financials.

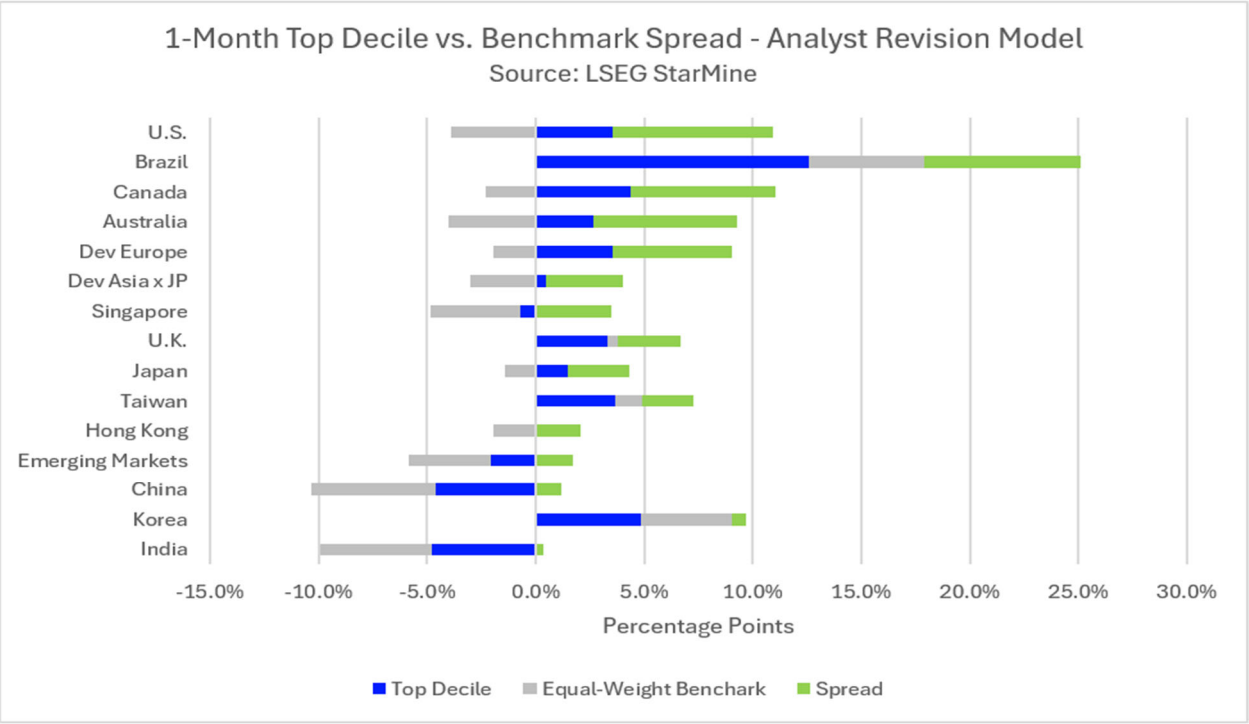

Amid elevated market volatility, Quality has also delivered the strongest year-to-date performance on both an absolute and risk-adjusted basis, with EQ recording the highest average monthly decile spread (1.9%) and Sharpe ratio (0.41).

Long-Only Performance

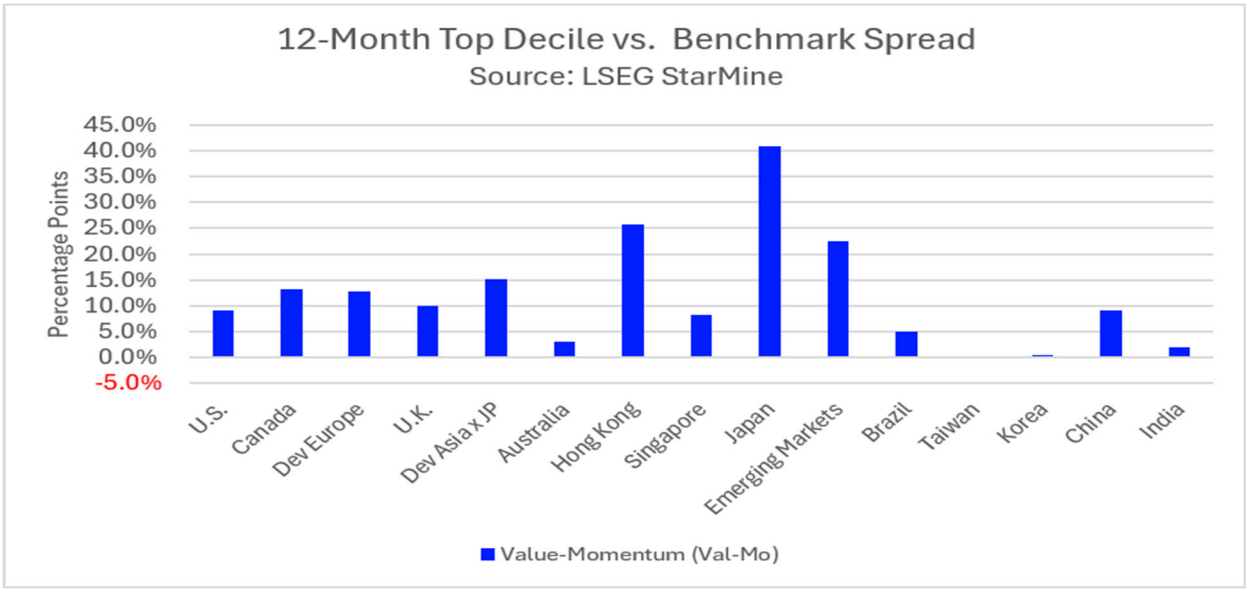

Most regions recorded negative top-decile performance, with Brazil a notable exception, delivering positive returns across all models.

Relative to the equal-weight benchmark, ARM exhibited the strongest breadth, outperforming across all regions and countries, as shown below. U.S., Brazil, and Canada had the highest outperformance.

Over the past twelve months, top-decile performance has been strong across most models and regions, with Taiwan leading – delivering returns exceeding 25.4% across all models.

Relative to the equal-weight benchmark, Val-Mo has exhibited the strongest breadth, with positive relative performance across most regions and countries.

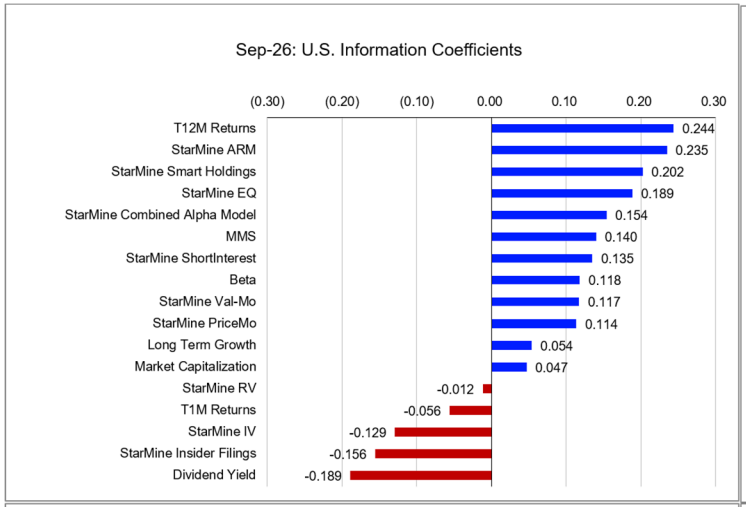

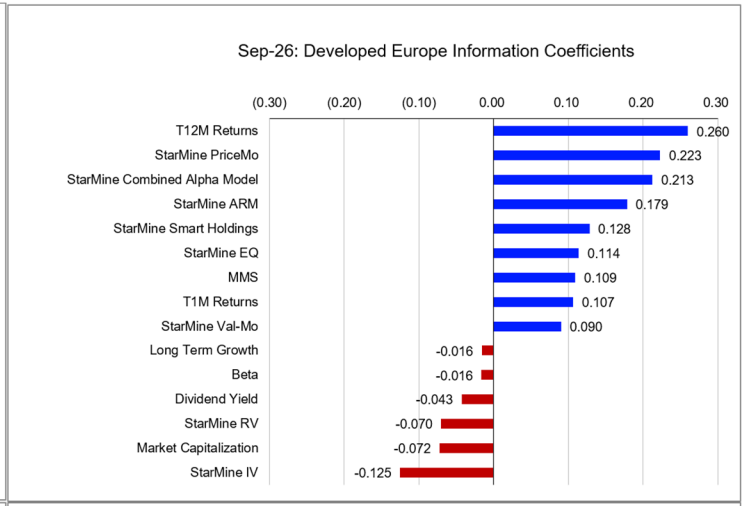

What Worked This Month

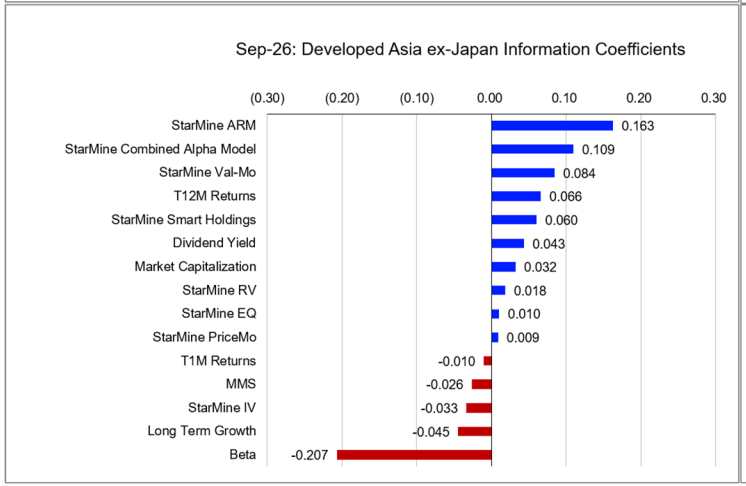

Momentum factors broadly outperformed Value factors in most markets. Value-Momentum (Val-Mo) had the strongest breadth, with information coefficients (IC) above 0.05 across most markets, led by Canada (0.20), Emerging Markets (0.19), and Brazil (0.17), while Korea was negative (-0.14). Analyst Revision Model (ARM) and Combined Alpha Model (CAM) also showed broad strength, with IC's above 0.05 across most markets, excluding Korea and China.

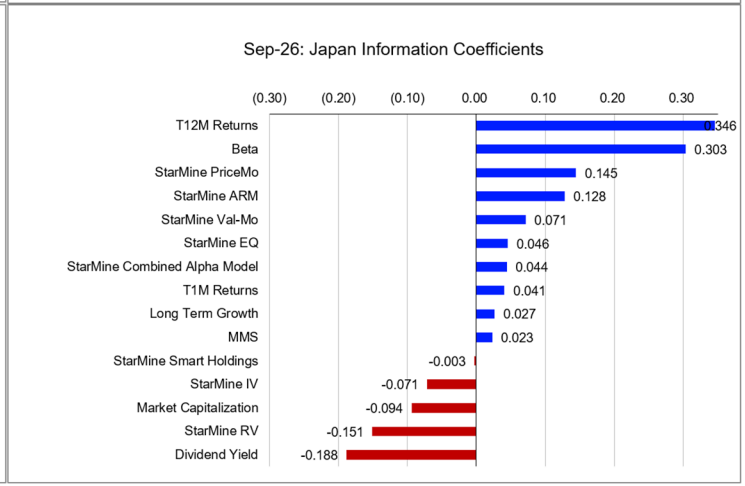

In the U.S., StarMine MarketPsych Media Sentiment (MMS) recorded its highest IC on record, while ARM and EQ posted their strongest readings since January 2024. Momentum outperformed Value, with ARM and PMO recording ICs of 0.23 and 0.11, respectively, compared with -0.13 for IV and -0.01 for RV.

The charts below display Information Coefficients for StarMine models and other common factors in September for selected regions.

United States – StarMine Models

The table below details performance of StarMine models in the United States. We display the performance in September as well as the annualized performance over the last 12 months. We also show performance of the corresponding benchmark models.

StarMine Model Definitions

This report details the performance of the StarMine Analyst Revisions Model (ARM), StarMine Earnings Quality Model (EQ), StarMine Intrinsic Valuation Model (IV), StarMine Relative Valuation Model (RV), StarMine Price Momentum Model (Price Mo), StarMine Value-Momentum Model (Val-Mo), StarMine Smart Holdings Model (SH), StarMine Short Interest Model (SI), StarMine Insider Filings Model, and StarMine Combined Alpha Model (CAM) for September 2026 and the trailing twelve months.
StarMine ARM is an estimate revision-based stock ranking system that improves on previous earnings revision models by incorporating more accurate earnings estimates through StarMine's proprietary SmartEstimate earnings prediction service; by utilizing other financial measures in addition to earnings; by including estimates on multiple fiscal periods; and by considering changes in analyst recommendations. For performance beginning in 2022, the ARM model monthly performance is based on signals from ARM 1.1. This updated version of the model uses the same algorithm but incorporates higher frequency data sources and an increased universe. The historical testing of this model shows results that are highly correlated to ARM 1.0 with slightly improved performance likely due to the more timely inputs.

StarMine EQ identifies companies that are likely to experience especially high or low earnings sustainability over the subsequent twelve months, based on decompositions of past earnings into sustainable and non-sustainable components.

StarMine IV identifies systematic biases in analyst earnings forecasts and leverages these findings to deliver an intelligent stream of EPS estimates called SmartGrowth earnings projections. SmartGrowth earnings projections significantly improve forecast accuracy and stock ranking ability and lead to more reliable equity valuation analyses.

StarMine RV intelligently combines information from six powerful valuation ratios – Earnings/Price, Cash Flow/Price, EBITDA/EV, Sales/EV, Book/Price, and Dividends/Price – plus share buyback activity into a single comprehensive measure of relative valuation. The model seamlessly blends information from both reported actuals and analyst estimates via StarMine's SmartEstimate and combines the valuation ratios in a weighting scheme that ensures the most important ratios for a given stock have the greatest influence in the final score.

StarMine Price Mo is a comprehensive measure of momentum in security returns. StarMine Price Mo combines information from multiple dimensions of price momentum – from the positive autocorrelation in returns at the 3-12 month time horizon to the negative autocorrelation in returns at short time horizons. StarMine Price Mo also incorporates information on industry-level price momentum and the degree of consistency, or volatility, in prior returns.

StarMine Val-Mo combines StarMine's two valuation models, StarMine Intrinsic Valuation and StarMine Relative Valuation, along with StarMine's two momentum models, the StarMine Analyst Revisions Model and the StarMine Price Momentum, into one powerful stock ranking model.

StarMine Smart Holdings ranks stocks based on the predicted future increase, or decrease, in institutional ownership. At the core of the model is an algorithm that reverse engineers each fund manager's purchasing profile based on the underlying fundamental factors of the companies the fund is buying. Once the profile is determined, the fundamental factors of all global stocks are compared to each fund's purchasing profile to determine the alignment between the stock and the fund, and then aggregated over all funds.

StarMine Short Interest is a U.S. stock ranking model that ranks stocks based on the hypothesis that stocks with high (low) number of shares shorted will under (out) perform. The StarMine Short Interest model intelligently normalizes short interest levels across companies of different market caps, and accounts for well-known arbitrage strategies (merger and dividend) that could affect levels of short interest. Please note that the Short Interest model performance results show up in the U.S. table as this is currently only a U.S. stock ranking model. employs proprietary methodologies to incorporate various types of security and options transactions, while also paying special attention to the timing of those transactions.

StarMine Insider Filings model ranks companies in the U.S. on the basis of the sentiment of company executives and directors about their company stock, as reflected in insider stock transactions and ownership. The model exploits the finding that agreement across insiders as expressed by buying (selling) stock is predictive of company out (under) performance in the coming months. Our intuitive model uses publicly available insider filings to assess two dimensions of insider sentiment: how many insiders are buying or selling company securities, and how much is being bought and sold by insiders. The model employs proprietary methodologies to incorporate various types of security and options transactions, while also paying special attention to the timing of those transactions.

StarMine MarketPsych Media Sentiment (MMS) model ranks companies based on public sentiments expressed across news and social media sources. The inputs are derived from LSEG MarketPsych Analytics covering sentiment on topics such as price expectations, earnings and management. The MMS model optimally combines the inputs to extract value from their distinctive long- and short-term effects.

StarMine's Combined Alpha Model (CAM) combines all available StarMine alpha models in an optimal, static, linear combination. The weights assigned to each model vary by geographic region. CAM takes advantage of the fact that some regions, such as the US and Japan, are more value focused while in Developed Europe and Asia ex-Japan momentum plays a larger role. The model intelligently handles missing data and makes use of all available models for a given security. The StarMine models used in StarMine CAM are Analyst Revisions (ARM), Relative Valuation (RV), Intrinsic Valuation (IV), Price Momentum, Earnings Quality (EQ), Smart Holdings, Insider Filings (US only), and Short Interest (US only).

StarMine Benchmark Model Definitions

We compare the StarMine models with appropriate commonly used quantitative factors that would most closely approximate a simple alternative factor used by portfolio managers.

The benchmark model for StarMine ARM is a basic revisions model, defined as the percentage change in the current fiscal year (FY1) consensus earnings estimate over the last 30 days based on data from I/B/E/S data from LSEG.

We compare the results of StarMine EQ to those of a basic earnings quality model based on total accruals, where total accruals is defined as the year over year change in net operating assets, scaled by total assets.

We compare the performance of StarMine IV and StarMine RV to a commonly-used valuation metric, earnings yield. The earnings yield factor utilizes next year's (FY2) consensus EPS estimates where available, else we substitute FY1 EPS estimates. In cases where there are no FY1 or FY2 estimates, we utilize FY0 EPS actuals.

The benchmark factor for StarMine's Price Mo model is a basic price momentum factor defined as the trailing 12-month total return.

For StarMine Val-Mo, we use an equal-weighted blend of the rank of the benchmark factor associated with each StarMine Val-Mo component. Thus, the StarMine Val-Mo benchmark factor is: Basic val-mo = 0.5*earnings yield rank + 0.25*basic revisions rank + 0.25*T12m return rank
Since earnings yield is a benchmark factor for two components, it receives a 50% weight in basic val-mo, rather than 25%.

The benchmark model for Smart Holdings is defined as the percent change in number of owners from the previous quarter. The Short Interest benchmark model is defined as the ratio of shares short to shares outstanding and the benchmark for the Insider Filings model is calculated as the ratio of the dollar amount bought to the dollar amount sold by insiders over the preceding 6 months.

The benchmark for the Media Sentiment Model is media sentiment-based price drift. News sentiment from the LSEG MarketPsych Analytics dataset is averaged over the prior 360 days. This sentiment value approximates that derived from alternative sentiment datasets.

The benchmark for the Combined Alpha Model is based on the equal-weighted average of the underlying models' benchmark ranks. The earning yield benchmark rank is incorporated twice in the calculations as it serves as the benchmark factor for two components (IV and RV).
