FX markets have started the week quietly, but the risks hanging over markets remain unresolved. Energy prices are still elevated on the threat of escalation in the Middle East, Coreweave's bonds still trade at 80 cents on the dollar, and French bond spreads are pushing wider as the French situation deteriorates. It is hard to get too bearish on the dollar

USD: Consolidation continues

FX markets have had a quiet start to the week. The dollar is down a fraction versus the commodity currencies, but up a fraction against the low-yielding yen and Swiss franc – the latter driven by some US equity stability and a modest back-up in short-dated US rates. Yet none of the key themes and threats have really changed. Energy markets remain nervous that the US and Israel may once again attack Iran ahead of the US Mid-Terms. Or at least energy prices are staying at their highs, preventing much of a correction in bond yields. Concerns over business models of the high-yield US data

centre providers remain, with Coreweave's 2032 bond still trading at 80 cents on the dollar. This represents the key threat to dollar strength. French debt spreads continue to widen as conclusions harden that France is still far from any fiscal consolidation.

This mixed picture extends across emerging markets too, where the Korean won and Taiwanese dollar are sharply diverging – having previously both traded together as chip exporters. The learning here is that central bank policy makes a big difference and the divergence can be explained, we think, by the Taiwanese dollar being punished for a local central bank failing to hike rates in September.

budget. Both the left and the right have attached numerous amendments to the original bill, meaning that even if it passes, markets are unlikely to welcome it. And the budget bill bouncing between the lower and upper houses into early December seems to be the base case. This week French sovereign debt also has to cope with a Moody's rating review on Friday. Here Moody's could play catch-up with the other agencies in cutting France to a single A-rated issuer. The move is expected; investors are underweight French debt, but there is still little concern that the loss of the final AA rating from the big three agencies could lead to some forced selling.

Despite French budget stress and high energy prices, eurozone business optimism has been holding up surprisingly well. That will be tested today with the release of the German ZEW index and on Friday with the flash PMIs across the region. These are all expected to edge a little lower, but probably not enough to dent the euro.

Expect EUR/USD to remain on 'OAT-watch' today. While a period of consolidation/correction looks necessary after a big fall in September, the case for a EUR/USD recovery remains weak. A move to 1.1180 looks as likely as a rally to 1.1270.

EUR/HUF briefly tested new lows but ended the day essentially unchanged.

Today, the fiscal narrative will continue with a joint press conference by the prime minister and the minister of finance; later, the Ministry of Finance will present further details to analysts, which should allow us to better assess the realism of the fiscal plan for next year. Overall, we maintain our previous view that the trade is currently too crowded, and we would not be surprised by a more significant correction, given how strongly Hungarian bonds rallied ahead of the budget plan's release. On the other hand, we remain

bullish on the overall story, and we expect that, sooner or later, the market will begin to fade the higher yields.

Today also features a meeting of the National Bank of Hungary, which is likely to leave interest rates unchanged at 5.50%. Although the NBH has cited knowledge of the fiscal plan as a prerequisite for further rate cuts, we believe it is still too early for the central bank to lower rates further. Forward guidance today could be positive in the sense of pointing toward more rate cuts, but at the same time, the central bank should take into account higher global energy prices.

Oil prices remain well-supported amid ongoing tensions in the Middle East despite relatively strong Persian Gulf flows. This suggests the market is pricing in a significant risk premium, given the situation's volatility. However, if flows continue uninhibited despite the geopolitical environment, the risk premium would likely erode slowly. Clearly, there are no signs of this yet.

Another major issue in the oil market is logistics. Namely, the record tanker freight rates we are seeing, given the less efficient use of tankers due to developments in the Middle East. The US is considering steps to allow the sale of sanctioned tankers, which

would increase tanker capacity in the legitimate market. The idea is to bring freight rates down and reduce the delivered cost of oil to destination. However, uncertainty remains about how much capacity this could add to the legitimate market. The process's duration means it may not offer immediate relief.

China released output data yesterday showing that domestic crude oil production rose 0.6% month-on-month and 2.5% year-on-year to 4.45m b/d in September. Meanwhile, refineries processed a little over 14m b/d of crude over the month, up 0.4% MoM but still down 8.4% YoY. This is the largest amount of crude processed by Chinese refiners since March. Along with previously released trade data, this s

Meanwhile, crude steel production edged up to 73.6mt in September. Demand, however, remained subdued due to the prolonged weakness in China's property sector. As a result, year-to-date crude steel output is still down 2.9% YoY to total 724.8mt in the first nine months of 2026.

Agriculture — India ethanol policy eases sugar supply concerns

Sugar prices fell for a second consecutive session, touching US¢20.5/lb. This followed India's suspension of sugar-based ethanol purchases by state-owned fuel retailers, easing concerns

over tight global supplies. The measure, effective from 1 November, follows weather-related reductions in sugarcane output that prompted the government to allow duty-free raw sugar imports. Recent estimates suggest India's gross sugar production could fall from 31mt last season to 28mt in 2026/27, as rainfall deficits in key producing regions weigh on yields.

Despite the recent correction, sugar prices remain more than 30% higher this year because El Niño-related weather risks loom across major producing regions. Investor sentiment also remains supportive, with money managers adding 4,477 lots to net long positions for a third consecutive week, bringing them to 261,841 l

4.5% YoY China's 3Q GDP

Higher than expected

China's 3Q GDP comes in slightly stronger than expectations

China's GDP rebounded to 4.5% year-on-year in the third quarter, up from 4.3% in the second quarter, a little stronger than expected

(market: 4.4%, ING: 4.4%). This brings the year-to-date GDP growth down to 4.6% YoY.

By industry, China's tertiary sector continued to grow fastest for the sixth consecutive quarter, up 5.2% YoY in 3Q, versus 3.6% and 3.4% for the primary and secondary industries, respectively. As China's economy matures, the services sector will play an even larger role.

A strong third-quarter trade surplus drove China's rebound. Final consumption expenditure's contribution to GDP, at 2.148pp, was at its lowest since 4Q22.

September's domestic data showed signs of stabilisation

September's domestic activity data generally improved from August, contributing to the 3Q26 GDP outperformance.

Below are our takeaways from the major data releases:

- Retail sales growth was stronger than forecasts (market: 0.5%, ING: 0.6%), rising to 1.1% YoY from 0.4%. Strong communication appliance (31.1%) sales drove the data, likely benefiting from a host of new phone model launches. Beyond this category, sales of consumer staples such as tobacco and alcohol (13.8%), grains & oils (6.7%), and beverages (5.0%) all outperformed. However, many discretionary consumption categories, such as gold and jewellery (-9.6%) and autos (-21.2%), remained weak.
- Fixed asset investment growth stabilised at -7.2% YoY after decelerating every month since March, coming in stronger than

what we saw in August's data. New home prices (-0.14% MoM) fell the least in 17 months. Prices stabilised or rose in 21 cities. Existing home prices (-0.26% MoM) saw the smallest drop in 4 months, with prices stabilising or rising in 11 cities. Tier 1 cities continued to perform well on the month, with a few tier 2 cities joining the price recovery.

Compared with rapid export growth, domestic activity continues to lag. But September's data at least shows modest positive momentum heading into 4Q26.

Growth remains unbalanced as property drag and soft domestic demand continues

R

than two years. Growth has stalled, wage growth has slowed sharply, real incomes are under pressure, and fiscal policy has tightened. Yet underlying inflation remains stubbornly high relative to both the rest of Europe and the National Bank of Romania's (NBR) target.

This disconnect between a cooling economy and persistent inflation is Romania's central macroeconomic story. While the country is still undergoing some income and price level convergence with the euro area – making a modest inflation differential structurally normal – that benign catch-up has been overwhelmed by much stronger forces. Years in which nominal

incomes and domestic demand outpaced productive capacity have been followed by a succession of overlapping energy, tax, and administered-price shocks, each feeding into wages, services, and short-term expectations before the previous shock had time to fade.

The headline figure is falling, but the underlying picture remains fragile

Romania's annual consumer price inflation fell from 10.4% in June to 6.2% in August, before edging up to 6.6% in September (6.5% on the EU-comparable HICP measure, with prices rising 0.77% in S

A relay race of shocks

Disinflation has been so slow partly because Romania has rarely enjoyed a clean window for one shock to fade before the next arrived. The pandemic supply shock was followed by the 2022 energy crisis. Energy price caps softened the initial blow to households but merely postponed the adjustment; their subsequent unwinding was followed by VAT and excise hikes in 2025, resetting the price level again. Before those effects could wash through wages and contracts, a new energy shock emerged in 2026. The NBR's August Inflation Report cited geopolitical

tensions involving Iran and low Danube water levels – which constrained hydro and nuclear output – among the factors pushing fuel and electricity costs higher, prompting the bank to raise its end-2026 inflation forecast to an optimistic 6.1%.

Because inflation is path-dependent, this sequence is more than a statistical twist. A temporary shock that leaves wage negotiations and pricing behaviour unchanged eventually vanishes from the inflation rate; a shock embedded into contracts and expectations does not.

Romania is unusually vulnerable to this dynamic. Food and energy n

competition. A manufacturer facing higher local costs can automate, relocate, or lose market share to imports. A restaurant, hairdresser, dental clinic, or maintenance firm cannot import its service from Germany; its costs and customers are local, making wages, rent, and domestic expectations the primary drivers of pricing.

While the 11.1% services figure also reflects lumpy adjustments in rents and regulated utilities, the broader message is clear: inflation has migrated from energy and traded goods into prices set inside Romania.

Wages: the legacy of a boom that has already ended

Wages are central to this story, though their timing matters more than their current growth rate. At the macro level, unit labour-cost growth roughly equals wage growth minus productivity growth:

Unit labour-cost growth ≈ wage growth – productivity growth

When wage growth outpaces productivity, the cost of producing a unit of output rises, forcing firms to accept lower margins, cut hiring, or raise prices.

beneath the cyclical slowdown, ready to reignite wage pressures once demand returns.

Imports: the safety valve that shows up as a deficit

When domestic supply cannot keep pace with demand, imports act as a safety valve. Both household consumption and capital investment in Romania are heavily import-intensive; when the government raises wages, pensions, or infrastructure spending, a large share of that demand leaks abroad.

For several years, excess domestic demand was absorbed not just by higher local prices, but by a widening trade gap, resulting in a current account deficit of 8.2% of GDP in 2024 and 7.9% in 2025, the largest in the EU. Imports thus prevented domestic inflation from rising even higher, but at the cost of a severe external imbalance and greater vulnerability to global commodity prices and exchange-rate shifts. Inflation and the current account deficit are ultimately two sides of the same coin: domestic demand persistently outrunning productive capacity.

Fiscal policy: yesterday's accelerator, t

demand effect is disinflationary.

This explains how Romania can combine weak activity with still-high inflation. Romania is currently caught between those two stages. The inflation data continue to reflect the impact of higher taxes, energy costs and regulated price increases introduced as part of the adjustment, even as the same fiscal correction is weighing on demand. Fiscal policy is now contributing to the cure, but some of the instruments used to achieve the cure temporarily worsen the inflation print.

The NBR and monetary policy: constrained, not cosmetic

Despite inflation sitting well above the NBR's 2.5% target, expectations have not fully de-anchored. Instead, anchoring has become horizon-dependent. Professional forecasters still see longer-term inflation near the top of the target band (with the NBR projecting 3.4% by the end of 2027), showing the target still anchors the destination. However, households and firms base their short-term pricing and wage decisions on the supermarket prices and utility bills they see today, leaving the target with little grip over the near-term route.

over the period during which those decisions pay off. If inflation is expected to decline toward 3.0-4.0%, nominal borrowing costs above 5.0% imply materially positive ex-ante real rates. The NBR's constraint is therefore not simply a reluctance to tighten. With the economy near stagnation, fiscal policy tightening, and supply-side shocks unresponsive to rate hikes, the NBR is sensibly relying on fiscal drag and weak consumption to do the heavy lifting – even if the lags are long.

The exchange rate: stabilising inflation, delaying adjustment

The leu formally floats, but the NBR has historically limited large EUR/RON movements. For an import-intensive economy, that policy has clear benefits. A large depreciation would quickly raise the domestic cost of imported goods. Exchange rate stability therefore acts as a second nominal anchor alongside the inflation target. But it also changes the way the economy adjusts.

The euro traded near RON 5.09 in March 2026, around RON 5.23 by May and roughly RON 5.34 by early October – a noticeable weakening of the leu after years of remarkable stability not far from the 5.00 level. Even so, the currency has moved far less than domestic costs. When Romanian wages and prices rise persistently f

That leaves the NBR facing a genuine trade-off. Allow more nominal depreciation and import additional inflation in the short term, or limit depreciation and accept a gradual deterioration in cost competitiveness when domestic costs rise faster than those of trading partners. Romania has largely opted for a modified version of the latter approach, managing to combine exchange rate stability with rapid wage growth and persistent inflation for several years. The needed adjustment did not disappear, however, but it was largely redirected into real appreciation and a wider current-account deficit. A stable exchange rate also preserved the purchasing power of rapidly rising incomes. That helped support

consumption growth and, given Romania's high import propensity, channelled part of the demand expansion into imports and a larger external deficit.

Productivity: the only durable solution, but one that takes time

Weak consumption and high interest rates can suppress inflation temporarily, but the only lasting cure is expanding productive capacity: better infrastructure, higher labour participation, stronger skills, and a larger tradable sector.

restrictive, real incomes are shrinking, consumption is weak, and growth is near zero. Yet the economy entered this slowdown carrying a massive overhang of unresolved cost pressures from 2023-24 and a fresh round of tax and energy shocks. Consequently, the most important metrics over the coming months will not be headline CPI prints, but adjusted CORE2 and services inflation. If they begin to fall as weak demand works through the economy, Romania is navigating a longer but ultimately conventional disinflation. If they remain sticky, domestic pricing has become backwards-looking enough to require a much longer period of economic

slack – or sharper policy intervention.

For now, the evidence points to persistence rather than de-anchoring. It is also important not to confuse Romania's inflation differential with macroeconomic imbalance. As long as the economy continues to converge towards euro-area income and productivity levels, the Balassa-Samuelson effects are likely to generate a modest inflation premium, particularly in domestically oriented services.

Romania is not trapped in a permanent high-inflation regime, nor has the recent dip in headline CPI completed the

France remains one of the focal issues in the eurozone. The spread of French government bonds over Germany has come under renewed widening pressure against the backdrop of violent protests grabbing the headlines.

The protests inject more uncertainty into the dynamics ahead of the presidential elections. On the right, Le Pen has jumped on public unrest to promote her law-and-order platform. Others have shifted the blame to the left. And indeed, if betting markets are to be trusted, the beneficiaries appear to be the right and centre candidates, while on the far left, Mélenchon's chances of winning

the presidential race have been pared back of late. For bonds, that might be the only consolation, as his plans are viewed among the most controversial.

More importantly, the protests highlight that any government will struggle to implement the required reforms and savings against broader public resistance.

Tuesday will likely see more headlines around the 2027 budget, as Parliament is slated for a first formal vote on the revenue section of the finance bill. From a flurry of proposed amendments, what remains is tax revenues being pared back and tax breaks expanded. It

USD: AI jitters leave USD on less solid ground

AI-related jitters entered the FX picture last week, although currencies are more accurately borrowing the reaction from the rates channel. The USD two-year OIS/SOFR has dropped 25bp from the 14 October post-US CPI print. These are mammoth moves considering they have been driven almost entirely by AI concerns, with effectively no macro input.

Markets appear to have a clear reaction function in mind: stock market turmoil is enough to drastically reduce Federal Reserve tightening plans, even with inflation running hot. The reasoning is probably linked to the market wealth effect that many believe has underpinned US economic resilience. This is enough to suggest the dollar will not be the safe-haven of choice and may actually lag many other G10 currencies if stock market instability originates in tech/AI.

Still, contagion to broader US and world equity indices has so far been contained, while the Nasdaq drop has only erased the last 30 days of gains. AI-related sentiment will remain an input for FX this w… a n… n… er F… b… a… ir…

Francesco Pesole

EUR: French protests may curb upside for now

EUR/USD briefly dropped back below 1.120 overnight before inching higher again this morning. The move in short-term rate differentials has pushed our short-term fair value estimate for EUR/USD higher to around 1.137-1.139. The current undervaluation is therefore around 1.3-1.5%, broadly consistent with French fiscal risk

remaining very much present, as reflected in the 10yr OAT-Bund spread hovering around 135-140bp.

Markets have appeared tentatively more relaxed about the budget situation. Still, continued widespread protests in France over the weekend should weigh on domestic stocks and could spill over into the bond market. We doubt that is enough to drive further sustained widening per se, but it may limit EUR/USD's ability to return to Friday's levels.

On the macro side, the highlight of the week is Friday's PMI release. Expectations are for a modest softening in the eurozone composite f

T

T
D
a

F

anchored around 2.0%.

The jobs market has given some warning signals, with two consecutive negative prints in August and September and the unemployment rate rising to 6.5%. Still, with growth proving resilient and a widening rate spread with the Fed, an (insurance) rate hike in December by the Bank of Canada remains a clear possibility. The BoC also releases its business outlook survey today.

Markets are fully pricing in a 25bp December hike, as well as 9bp for next week's meeting. That suggests limited upside for the Canadian dollar, even if the October meeting is used to set the stage for a

On Thursday, we expect the Central Bank of Turkey to resume its easing cycle for the first time since the US-Iran conflict began, cutting rates by 100bp to 36.00%. September's inflation data provided a positive signal, while developments in investment funds point to downside risks for the economy in the final quarter. Although crowded long TRY positions offer less and less carry, they remain popular in emerging markets, and we expect this demand to persist in the coming months despite renewed rate cuts.

Beyond the scheduled events, we are monitoring political developments in Romania, where the new government appears highly likely to win a confidence vote. This should help stabilise

EUR/RON after its decline late last week, and we expect the pair to settle around 5.340. In the Czech Republic, the Czech National Bank may offer its first signals ahead of the November meeting, when we expect another rate hike.

From better fiscal headroom to surprise income tax hikes, this is how UK Chancellor John Healey's first budget could surprise investors

Higher debt interest costs look set to drive the level of 'fiscal headroom' from £24bn in March to £10bn. There's a growing sense that Chancellor John Healey would like to get this up to £15bn or higher. The government is set to modestly increase spending on the cost of living, though the total intervention is unlikely to meaningfully top £5bn and it's likely to be mostly billed as temporary to avoid counting against the main fiscal rule. We expect an increase in capital spending of roughly £10bn/year, bearing in mind this is exempt from the fiscal rule dictating that the current budget must be in surplus after five years. To rebuild headroom

against that rule, we expect £5-6bn of tax hikes, likely via a higher Bank Surcharge and possibly broadening the National Insurance tax base.

In short, we don't expect the budget to deliver a material stimulus (or add materially to the already-planned fiscal consolidation). The impact on the Bank of England, which is poised to hike rates in November, is likely to be fairly minimal.

But all chancellors like to keep a rabbit in their hat – and what follows are five ways it could surprise us.

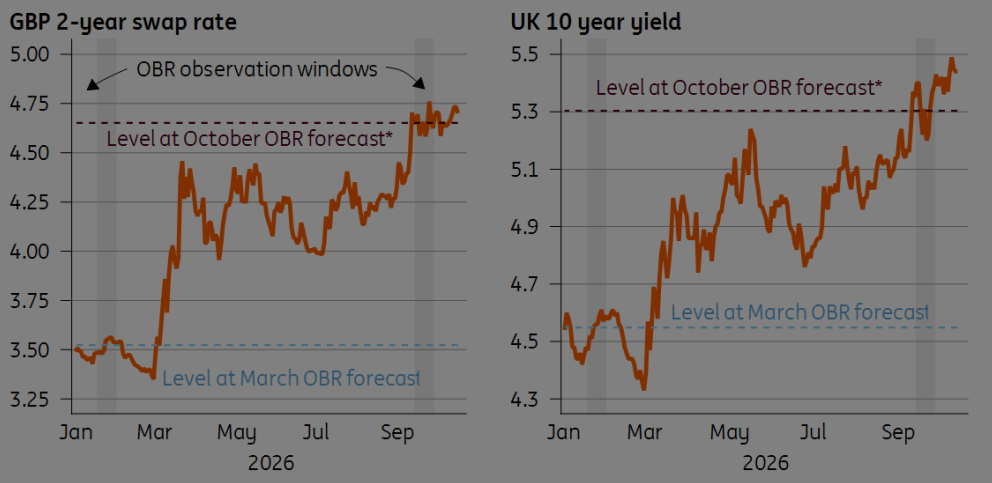
government has left under its main fiscal rule, which requires the current budget (day-to-day spending, including debt interest less revenue) to be in surplus within three years. Back in March, that surplus, or fiscal headroom, was projected at £24bn in 2029/30.

Debt interest costs are rising



*Based on the average rate in the 10 days up to 25 September, which likely represents the OBR's observation window for this budget

growth. Will the rise in energy prices spill into higher pay, just as it did in 2022? We think it won't, not least because the jobs market is much weaker, an assessment we suspect the OBR will share.

But even relatively small upgrades to wage growth can make a big difference to the government's fortunes. Since 2010, the OBR has revised the level of earnings across its five-year forecast by an average of 1.3 percentage points in absolute terms. If it did that now, say by lifting wage growth over the next two years by 0.6ppt apiece, it would add £10bn to headroom, almost perfectly offsetting the hit from higher interest costs.

There are also reasons to think the impact of lower migration projections, which some reports suggest could wipe another £7bn off headroom via lower tax revenue forecasts, could be much less than feared. The starting point for employment looks a little higher than it did back in March. The rise in global equities this year should also be helpful for capital gains tax projections.

Why does this all matter? Because the higher the headroom, the less 'need' there is to hike taxes, and if it is significantly higher than expected, the more room there is to increase spending under the fiscal rules.

substantially smaller real-terms budget increases across the medium term.

Even before the Iran War, government plans pencilled in real-terms cuts to per capita departmental spending in FY2029. Given some functions, like health, are 'protected', that implies much deeper cuts to smaller departments.

Suffice it to say, that is unrealistic. Higher inflation will push up the wage bill across government. It would cost £12bn to simply maintain those March departmental spending plans in real terms. That's before considering the cost of ending that austerity pencilled

in for later this decade, or how the government will fund its defence or social care ambitions.

A top-up to government departments is inevitable – the question is when. It looks like the Treasury wants to kick the can on these tricky budget decisions until next autumn, when it plans to release its next Spending Review, a process of allocating money across departments. No doubt the hope is that debt interest costs will have fallen and the economic outlook brightened, such that there's more space under the fiscal rules to make bigger spending commitments.

all these policy changes affect GDP growth and borrowing over the next year. If there's a material stimulus effect, it could add to market bets on UK rate hikes.

3. A manifesto break on income tax

Tax hikes are likely at the Autumn Budget, but should be very small. We're probably looking at a package of circa £5bn (0.2% of GDP). Part of the problem is that the list of viable options looks perilously small if Labour is to avoid breaking its manifesto pledge not to raise

the major taxes, which together account for around 70% of total revenue.

Our best guess is that the budget will include a hike in the Bank Surcharge (raising £2bn if increased from 3% to 8%), together with a broadening of the tax base for National Insurance to landlords and partners in LLPs (together yielding around £2bn/year). Other options, like ending a loophole on stamp duty for commercial property or lowering the VAT threshold for businesses, have also been on the table.

The problem with many of these measures is that they require

Is
tax – one good, one bad.

The good? A surprise announcement of a so-called ‘tax switch’, a novel proposal from Resolution Foundation which would see the government simultaneously raise basic income tax and cut employee National Insurance by 2ppt. The impact on workers would be neutral, but because income tax has a broader base (including pensions), this would raise £6bn/year.

Though not a substantial sum, it would signal to investors that Prime Minister Andy Burnham isn’t afraid to go near the thorny issue of raising taxes. But in light of recent pension changes,

including to the infamous ‘triple lock’, this feels like too much of a political gamble at this stage.

The negative surprise would be if the Treasury decided to raise the basic tax allowance. Burnham flirted with this on his first day in office; it would not only be expensive (potentially £10bn), but it would also signal that the UK’s commitment to the threshold freeze – which is doing the lion's share of the planned fiscal consolidation – is waning.

4 A big rise in the National Living Wage

The minimum wage increase in April 2027, which will be a

to be growing recognition among Labour figures, including on the left of the party, that the big minimum wage increases, coupled with previous payroll tax increases, have had a big impact on business – particularly in consumer services.

But if the LPC were to recommend minimum wage growth of close to 5%, could the government resist it? In theory, yes. But politically, we suspect not.

5 A surge in bond issuance

We already know that bond issuance is set to increase again in 2027, though for reasons unrelated to the UK’s fiscal trajectory.

The chart below shows that in April, the Debt Management Office projected a gross financing need of £308bn, similar to the big number in FY2025. We suspect that when we get the updated DMO remit following the budget, next year's issuance could be closer to £325bn – though a greater chunk of that will likely get funded using bills, meaning the actual pick-up in gilt sales relative to those previous plans is likely to be more modest.

How debt issuance plans broke down as of March/April

S
borrowing is still likely to be projected to keep falling through the rest of the decade. The major risk – related to some of the things discussed earlier, like larger near-term spending or surprise increases in tax allowances – would jeopardise this fundamental improvement in bond issuance in the medium term. That's something investors wouldn't take kindly to.

USD: What does the flatter yield curve mean?

The sell-off on Coreweave assets saw a modest reversal yesterday after Nvidia's CEO, Jensen Huang, said that Coreweave's financial strength was improving and its cost of capital was declining. Perhaps those comments should not be surprising from a major shareholder in Coreweave; let's see how long this bounce in Coreweave assets lasts. The big takeaway this week has been the recovery of the long-end of the US Treasury market, even as

inflation data continues to come in hot. Here it seems that investors are starting to find value in long-dated Treasuries and are viewing those as a middling hedge against a correction in the AI trade. Were the tech sell-off to gain momentum, that Treasury buying would move to the shorter end of the curve.

While fears of an AI correction may be growing, inflation data continues to come in hot. Yesterday it was US September PPI data blowing away consensus. And today, import prices should come in near 8% year-on-year, the highest since summer 2022. Inflation data is keeping short-dated interest rates supported and has delivered a near 20bp flattening in the 2-10 year Treasury curve t

today

Today's eurozone data should see September CPI confirmed at 3.8% – well above the European Central Bank's 2% target. Markets are still reeling from the hawkish set of inflation forecasts delivered at the ECB September press conference, a key driver of the near 75bp of further tightening expected from the ECB. Our team looks for just one more hike, however, and developments in French bond markets will have a big say in whether the ECB needs to tighten much more from there.

EUR/USD has received a lift from this week's unease in US AI stocks and may be entering a decent consolidative phase now. This could be worth a move all the way to 1.1340/50. But do not expect EUR/USD to be the big outperformer on a further US equity correction. We think a lower USD/CHF would take the lead there.

Chris Turner

CEE: Wage embers and price sparks

The CEE week ends with mostly second-tier data. Hungary releases August wage figures this morning, one of the central bank's remaining domestic obstacles to achieving stable inflation. We f

have outperformed the rest of the region over the past two days. We maintain the view that the koruna and zloty yield curves cannot decouple from the global narrative, and that higher energy prices will keep rate hikes priced in for longer. The Hungarian curve will face a test next Monday or Tuesday with the release of the draft budget for next year – an event drawing significant market attention, though expectations may be overly optimistic. FX, on the other hand, remains more or less stable, and we continue to hold our bearish views for the CEE region in general.

IDR: MSCI downgrade warning sinks local assets

In a statement that will have been a difficult read for Indonesian authorities, MSCI said overnight that it was launching a consultation to reclassify MSCI Indonesia indexes from Emerging Market to Standalone Market status. Merely dropping Indonesia to Frontier Markets would not properly recognise the depth of the market problems, says MSCI. These problems are opaque shareholding structures and suspected coordinated trading behaviour, according to MSCI.

Manufacturing is gaining momentum

Today has seen the release of another decent US industrial production report. September output rose 0.7%MoM/2.2%YoY plus there was a 0.1ppt upward revision to August's growth rate (consensus was looking for a 0.4% gain overall). Manufacturing did OK, rising 0.3% month-on-month, especially when we consider that auto volumes fell 3%, while utilities surged 3.5% MoM as output is ramped up to meet demand from data centres and expanding manufacturers. Mining was up only 0.2% MoM.

The sector has struggled in recent years with stagnant output, but the business surveys have all been pointing to an improving picture. The chart below shows the relationship between manufacturing output and the ISM manufacturing series, with the latter suggesting further decent gains are likely. The labour market data tells a similar story with 72,000 manufacturing jobs added year to date, after three consecutive years of net job losses in 2023, 2024 and 2025. Average weekly hours worked in the sector are at a 3.5-year high of 40.6.

US ISM manufacturing index and official r

T supporting

So why is US manufacturing doing so well? Tariffs on foreign-made products and energy security do boost the attractiveness of manufacturing in the US. But so does US economic growth continuing to outperform other key markets. Between 2023 and 2026, the US economy has grown an average of 2.5% year-on-year in volume terms versus 0.9% in Europe.

At the same time, the US Administration believes maintaining the lead in the AI/technology frontier is imperative for both economic and national security, given competition from China. Rapid AI

adoption is leading to robust construction of data centres, boosting electricity demand and spurring investment across the power supply chain, from generation and transmission to electrical equipment.

As we can see in the chart below, high value-added or advanced manufacturing, within which we group tech, electronics, transport and power-related sectors, has significantly outperformed other sectors. We expect this story to continue. We also see defence as a sector that should continue to post strong growth. As more countries increase military spending, US companies may benefit from strengthening order books.

Traditional, labour-intensive, commoditised manufacturing sectors continue to shrink under pressure from foreign competitors. Here, tariffs are not enough to provide the competitiveness boost needed to offset the high cost of production in the US. These US producers are also often detrimentally impacted in foreign markets by retaliatory tariffs.

Bifurcation set to intensify

As we outlined in our latest manufacturing outlook , highly automated, high-value-added sectors at the forefront of the

AI/technology revolution will continue to perform strongly. The desire to incorporate AI advances should, in theory, drive advances in productivity-enhancing initiatives that further support innovation. As such, pharma, tech, transport & aerospace, electrical and power-related sectors should continue to grow robustly. Lower value-added production, where labour costs make up a greater share of the overall cost base of production, will continue to struggle unless it can garner a 'made-in-America' premium.

This was supposed to be a decisive week for Belgium's public finances. The prime minister was due to deliver his general policy statement to parliament on Tuesday, outlining a budget agreement among the governing parties for the next three years, up to the 2029 elections. In addition to measures already adopted, the government is seeking €10bn in recurring savings, phased in over the next three years.

A new timetable for negotiations

For now, however, the budget talks have failed to produce an agreement. A central element of the package was a one-

percentage-point increase in the standard VAT rate, from 21% to 22%, but one coalition party firmly opposed the proposal. The general policy statement therefore had to be postponed. Under Prime Minister Bart De Wever's revised timetable, the immediate priority is to secure agreement on the 2027 budget, including €4bn in savings.

Ideally, a deal would be reached by the end of October, allowing parliament to debate and approve the legislation before year-end. This would avoid recourse to the system of provisional twelfths, under which the previous year's budget is rolled over on a monthly basis to keep public services running. The PM has made clear that h d t c e

I a b l t y t w t c d

A

There is no political crisis at this stage. With a package of measures, Belgium should still be able to adopt a 2027 budget that brings the deficit below 5% of GDP. Even so, failure to reach a swift and comprehensive agreement on the full €10bn package is a missed opportunity for the federal government to show financial markets that Belgium is not France.

On headline indicators – public deficits, debt and even economic growth – little separates the two countries. France's difficulty, however, lies in its inability to set and pass a budget, compounded by the political uncertainty surrounding the April 2027 presidential election. Belgium, by contrast, has a governing majority capable of

approving a budget and pursuing structural reforms, as it has demonstrated since 2025. A three-year agreement would have sent a powerful signal that the country's public finances were being placed on a more sustainable path.

For now, that opportunity has been missed, though we still believe some less ambitious agreement is likely in the coming weeks.

Persian Gulf oil flows pick-up

There are few signs of de-escalation in the Middle East. If anything, it appears as though the conflict is broadening, with the Houthis in Yemen increasingly targeting Saudi Arabia. Despite little improvement in the geopolitical environment, oil flows from the Persian Gulf have been trending higher with supply from the region returning to 70-75% of pre-war levels, although there are some estimates suggesting we could be back to as high as 80-90% of pre-war flows.

The fact that oil prices are well-supported despite the improvement in flows from the region appears to reflect concerns over how sustainable this supply is, particularly when considering the geopolitical backdrop. The market continues to price in a large risk premium in the absence of a deal between the US and Iran. And to see this risk premium erode, the market may need the comfort of a deal. Failing that, time may be enough for oil prices to trend lower, assuming supplies from the region continue to hold up. For now, we are holding onto our 4Q26 Brent forecast of $80/bbl and FY27 forecast of $71/bbl. However, given the high level of uncertainty, this is a low-conviction call, specifically for 4Q26.

are likely to remain elevated.

Natural gas vulnerable heading into heating season

European natural gas prices have traded at their highest level since December 2022, with supply concerns growing as the region heads into the heating season. Unfortunately for the natural gas market, we have not seen a similar recovery in LNG flows from the Persian Gulf as we have with oil. Therefore, LNG flows from the region remain down about 80% year-on-year. The market is increasingly

accepting that Persian Gulf LNG could remain largely absent from global markets for much of the Northern Hemisphere winter. This means Asia and Europe will continue competing for spot cargoes throughout the winter, keeping prices well supported and leaving the market vulnerable to further spikes.

European gas storage remains a concern, at just under 75% full, well below the five-year average of 89%. Low storage has seen the German government instruct state-owned SEFE to buy and store an additional 8TWh of natural gas by 15 December. The prospect of essentially forced buying provides further support to the market.

Climate and weather-related shocks are a growing source of supply chain risk. In August, the Rhine River's water levels hit a record low since 1880, hindering trade flows across Europe. In 2024, Hurricane Helene affected global tech and medical supply chains by flooding key ultra-pure quartz production facilities in the US. The upcoming "very strong" El Niño could substantially disrupt temperature and precipitation patterns across the globe next year, putting, for example, food production and trade at risk.

These events underscore the need to build supply chain resilience. Extreme weather is now a more impactful part of the supply chain

risk landscape alongside geopolitics and other risks.

Yet significant gaps remain. First, while the awareness of supply chain climate risks is rising, many companies have yet to acknowledge their financial materiality. Second, the uptake of financing solutions has not kept pace with supply chain resilience needs, despite trade finance supporting around 90% of global trade. This leaves financial institutions well positioned to expand financing solutions that support corporate supply chain resilience. Below is how they can do it.

Expanding banks' toolkit for supply chain r

- The traditional supply chain and trade finance solutions can be tailored to integrate resilience objectives. For example, guarantees can support cross-border trade in climate-resilient goods, while preferential financing terms can reward companies that actively manage supply chain risks. By incorporating supply chain risk assessments into financing programmes and linking working capital solutions to supplier resilience, these products can help companies better withstand disruptions and support long-term growth.

- **Climate and resilience tech finance**

- Banks can provide financing and advisory services to help scale and deploy technologies that strengthen supply chain resilience. Examples include water management technologies, regenerative agriculture, and indoor farming. These solutions can improve the upstream supply chains of industries such as food, beverage, and hospitality. As interest in resilience technologies grows, financial institutions are increasingly developing tailored financing solutions to support their adoption.

- **Blended finance**
  - Some resilience technologies, projects, and markets may

As banks work to expand their financing offerings to enhance supply chain resilience, companies would benefit from doing their part as well. My colleague Rico Luman has written about some best practices companies can adopt in their day-to-day operations. These include building up inventory of high-risk supply materials, diversifying suppliers and transport routes, and improving supply chain visibility. Financing solutions that link resilience to working capital, for example, can help companies strengthen these efforts.

Companies can also look beyond day-to-day operations and invest in longer-term resilience initiatives, such as climate-resilient materials, water management technologies, and other adaptation s

Agentic commerce fundamentally changes the buying process

Retail is entering a new phase of digital disruption. E-commerce has already transformed *where* consumers shop; agentic commerce is set to change *how* they shop. Autonomous artificial intelligence agents can search, compare and purchase products on behalf of consumers, shifting shopping from an active task to an increasingly automated background process.

Agentic commerce goes beyond AI assistants and comparison websites

Key differences between agentic commerce, AI assistants (such as ChatGPT and Gemini) and comparison websites

	Agentic commerce	AI assistants	Comparison websites
Role in customer journey	Actively manages parts of the customer journey	Provides information and recommendations	Helps consumers compare products and prices
Degree of autonomy	High: can execute tasks independently	Low to medium: provides recommendations	None
Decision-making role	Makes decisions	Decisions remain with	Decisions remain with

optimal time to buy.

Adoption is likely to be slower for luxury, trend-sensitive and experience-driven products. In these categories, inspiration, emotion, and personal preference remain central to the purchasing decision, making consumers less inclined to relinquish control. AI agents can assist by pre-selecting products that match predefined preferences, but final purchasing decisions are likely to remain firmly in the hands of the consumer.

Consumer electronics and personal care lead the adoption of agentic commerce

Within non-food retail, agentic commerce appears particularly well suited to consumer electronics and personal care. Both sectors are characterised by a high degree of product standardisation and a large share of repeat purchases, making them ideal candidates for AI-driven purchasing.

In consumer electronics, purchasing decisions are often based on objective and easily comparable criteria, including price, technical specifications, and availability. This makes products such as t

Chinese platforms lead adoption

Agentic commerce creates the greatest opportunities for large global marketplaces and technology companies. These players combine vast product assortments with the scale, data and infrastructure needed to deploy AI agents effectively. Their integrated ecosystems, including payment solutions, logistics networks, and data platforms, enable them to integrate AI agents into their business operations faster and more effectively.

Chinese platforms such as Alibaba and JD.com currently lead the way, with AI agents already deeply integrated into their respective platform networks. These agents can not only provide product

recommendations but also complete purchases autonomously. Meanwhile, US technology companies including Amazon, Google, Meta, OpenAI and Anthropic are investing heavily in the development and rollout of AI agents, intensifying the global race for leadership in this emerging market.

European players are structurally lagging behind their American and Chinese competitors. Stricter regulation and less integrated platform networks limit their ability to bundle scale, data and services. While Zalando is among Europe's frontrunners in AI-powered retail, its applications are currently focused on product discovery, comparison, and selection. Fully autonomous p

Retailers that successfully integrate their physical and digital channels, define clear roles for their stores, and deploy technology strategically can strengthen their position within the customer journey. In a future shaped by AI-driven commerce, their role will increasingly centre on adding value where automation cannot.

Crude tanker rates have hit all-time highs amid the prolonged Iran war and Strait of Hormuz disruption. Restructured oil flows and a rush for capacity to handle oil transport operating under military protection have driven rates sharply higher, adding further pressure to fuel prices alongside strong refinery margins

Tanker shipping thrives in risky waters amid a continued capacity squeeze

Oil tanker markets sit at the centre of geopolitical turmoil, and this year that has translated into record-breaking freight rates as the conflict in the Middle East drags on. Tankers have been caught up in sanctions regimes and repeatedly targeted in key shipping lanes, including the Strait of Hormuz, Bab al-Mandeb and the Gulf of Aden.

At the same time, demand for tanker capacity has surged as traders seek alternative routes and sources of supply, including

increased shipments from the US. The opening of a protected corridor through Omani waters has enabled additional crude exports and vessel movements, but has also placed further strain on an already stretched market. Shuttle services now operate around the Strait of Hormuz, with under the radar activity and ship-to-ship transfers taking place outside the chokepoint.

The conflict and tanker seizures in the Persian Gulf erupted at a time when the market was already facing a shortage of capacity. New deliveries of crude carriers slowed sharply following a record-low order book in 2022-23, while an increasing number of older and smaller vessels joined Russia's shadow fleet, further reducing the p

Crude tanker earnings rose tenfold on rush for capacity

The capacity squeeze, combined with operating in risky war zones and facing highly elevated insurance premiums, has sent tanker rates soaring. We have seen previous surges in this volatile market,

such as in 2022 after sanctions were placed on Russia, but this spike is beyond levels ever seen before.

Average global crude vessel earnings exceeded an unprecedented level of $500,000 per day, 10 times the 2025 average, in early October. For Suezmax tankers and very large crude carriers (VLCCs, with a maximum capacity of 2m barrels) alone, rates surged even beyond that. Crude shipments from Ras Tanura in Saudi Arabia to Rotterdam made up about $2/bbl in 2025; in September, this surged beyond $35. Combined with high refinery margins (the current crack spread of diesel in Europe is about 2.5 times the 2025 average), this could add over $0.50 to the base price of a litre of d
