THINK Ahead: Politics meets the bond market (again...)

Not for the first time, it's Britain leading the way in what has been a grim week for the global bond market. Political drama is back, interest rate expectations are rising. But for all the noise, James Smith argues there are limits on how much politics is likely to drive central banks this year. Read on as he and the team look ahead to another busy week in markets

The UK's Mayor of Manchester Andy Burnham has his sights set on Downing Street

Politics meets the bond market (again...)

Let's face it: nobody does political drama quite like Britain. In a competitive field of big global stories – a global energy crisis, a meeting of two superpowers – the limelight has still somehow found its way back to London.

In case you're struggling to keep up (and who can blame you), the ruling Labour Party is in the midst of a leadership struggle. Prime Minister Keir Starmer, though still in office, is under existential pressure after poor local election results. A leadership contest looks increasingly inevitable. And if you believe the betting markets, Manchester Mayor Andy Burnham is the man to beat.

All of this has unfolded against the backdrop of a grim week for global bond markets. The UK's 10-year yield rose by more than a quarter of a percentage point. But Britain is hardly alone. US yields are up around 20bp this week, while Germany's are higher by roughly 13bp.

That's an important reminder. For all the noise coming out of Westminster, it is still oil prices – and the outlook for global central banks – that are doing the heavy lifting for interest rates, both at the short and long end.

Of course, politics could matter more from here. There is [certainly scope for gilt yields to rise further](#) on domestic drama. But in practice, will politics really be a central driver of central bank decisions this year?

When it comes to Britain, I think it's important to keep things in proportion.

Yes, the political centre of gravity is likely to shift left. And yes, there is pressure to adapt the fiscal rules. But politicians across the spectrum are presumably acutely aware there are limits, with the shadow of the 2022 “mini-budget” crisis still hanging over Westminster.

Where leadership hopefuls are talking about higher borrowing, the emphasis is overwhelmingly on investment – particularly capital-intensive areas such as defence and social housing. In practice, we suspect any additional borrowing, if it materialises, is unlikely to exceed £15–20bn per year.

That is not trivial. And investors would no doubt start to question the UK's longer-term commitment to fiscal restraint, particularly as we edge closer to what could be a challenging 2029 general election.

But that is not quite the question facing the Bank of England.

The Bank needs to judge whether a modest fiscal pivot of this kind would materially boost inflation over a two-year horizon. And if it's going to be centred on investment, it's worth recalling that Britain's recent track record of actually building things is... not great.

Private housebuilding is almost 20% below its pre-Covid level. Firms consistently cite planning constraints and regulation as key bottlenecks. Britain's infrastructure delivery record is no more inspiring.

That suggests any fiscal boost is unlikely to move the dial much for the Bank of England in the near term, particularly when you remember the next Budget isn't due until late Autumn. And with investment, there is always the counter-question of how much it lifts the supply side of the economy and productivity, offsetting any inflationary impulse.

If you want a cautionary tale, look at Germany. Optimism last spring around vast defence and infrastructure spending faded quickly as it became clear that this was not something that

would happen overnight.

A year on, there are some signs of progress. Defence spending, for example, began to pick up late last year. Carsten Brzeski [argues](#) the impulse is now “real”, with effects increasingly likely to show through this year and next – energy crisis notwithstanding.

Which brings us neatly back to energy.

When it comes to politics and its relationship with central banks, the far bigger question is whether governments across Europe are forced into much larger support packages than we have seen so far. The fuel tax cuts announced in various countries are small beer compared with the 2–3% of GDP packages rolled out in 2022. That, in no small part, was why central banks across Europe were forced into steep rate hikes four years ago.

Whether similar pressure builds again this time will depend, above all, on where energy prices go next. You can find our scenarios in the latest [ING Monthly](#), or listen back to Warren Patterson walking through his outlook in our [recent webinar](#).

Two points from that discussion stand out.

First, even if the war were to end tomorrow, energy prices may not fall as far as many expect. Significant drawdowns in oil inventories are likely to keep upward pressure on prices for some time yet.

Second, natural gas prices currently look too low. There is meaningful upside risk if disruptions persist into the third quarter, particularly as competition intensifies between Asian and European buyers for LNG.

It's a reminder that, for all the political noise, its energy prices will remain the dominant force for central banks. It's why we're expecting rate hikes from the Bank of England and European Central Bank in June, and why we no longer expect a Federal Reserve rate cut until December.

James Smith

Three scenarios for global energy markets

Source: ING

THINK Ahead in developed markets

United States (James Knightley)

- **Housing starts** (Thu): It is a quiet week for US data, with a focus on housing numbers. High prices and elevated mortgage rates are an obvious headwind that is hurting affordability and depressing activity. We will also have the FOMC minutes, which will underscore the hawkish shift seen in April when three members wanted more neutral language on where interest rates may head.

United Kingdom (James Smith)

- **Inflation** (Wed): Headline inflation is actually likely to dip in April's data, due next week. That might sound strange as energy prices surge. But the timing of Easter is set to temporarily push down on CPI. So too will the fact that many of last year's administrative/regulatory price hikes weren't repeated at the start of this financial year – or not to the same extent. We're also looking for signs that lower wage growth and greater economic slack results in more muted annual price hikes across the service sector. If we're right, that should make some Bank of England officials more relaxed about the risk of second-round effects from the current energy crisis.

THINK Ahead in Central and Eastern Europe

Poland (Adam Antoniak)

- **Industry** (Thu): Activity in industry is on a roller-coaster ride. Following subdued output in the first two months due to harsh weather, industry rebounded sharply in March. Still, the general trend is far from positive. Industry has been nearly stagnant in recent years and weak external demand along with mounting competitive pressure from China poses a challenge for some sectors. At the same time, the Middle East conflict and unfolding

energy crisis imposed yet another layer of risks and uncertainty. We expect the recovery in manufacturing to lose momentum ahead, even if short-term performance might be boosted by stockpiling. Upward pressure from energy commodities probably lifted PPI from over two-year-long deflation.

- **Labour market** (Thu): Wage growth continues its downward trend as the situation normalises after double-digit growth in 2023-24. In April, the lower annual dynamic was also probably facilitated by a high reference base due to high growth in mining. Employment in enterprises continues shrinking at a pace nearing 1% year-on-year as declining labour supply is facing somewhat softer demand.

Hungary (Peter Virovacz)

- **Wages** (Wed): It is hard to imagine anything stealing the limelight from the political headlines in Hungary nowadays. However, the ongoing issue of high wage growth would certainly exacerbate the complicated situation of the National Bank of Hungary. Strong real wage growth and rising consumer confidence could increase pipeline price pressure on top of the energy price shock. Meanwhile, the movement of the forint towards territory that would prompt the central bank to consider a dovish pivot sooner than expected is adding spice to the situation.

Czech Republic (David Havrlant)

- **PPI** (Wed): Higher oil and natural gas prices continued to pass through to producer pricing, when annual price dynamics in industry likely switched to positive territory in April, following more than a year of annual declines. This will further foster pressures on consumer prices, where goods price gains quickened in April.

UK asset markets starting to feel the heat

UK markets were under pressure on Friday as the leadership battle within the ruling Labour Party starts to open up. 30-year UK gilt yields have risen to levels last seen in early 1998 and independent sterling weakness is really starting to come through. A long hot summer for UK politics warns of more to come

What's happening

UK markets were under pressure on Friday as the leadership battle within the ruling Labour Party starts to open up.

To recap, this week's turmoil follows a very weak, but not totally unsurprising, set of local election results for Labour earlier this month. With Nigel Farage's Reform Party dominating the polls, and the Green Party increasingly dividing Labour's share of the vote, there's growing pressure on the party to change direction as it looks ahead to the next General Election in three years' time.

So far, formally at least, no leadership contest has been triggered. Keir Starmer remains both

Labour leader and prime minister. But it is only a matter of time.

Wes Streeting, until this week the Health Secretary, has resigned and is expected to stand, though it remains unclear whether he has support from the 81 Labour MPs required to trigger a contest. Comments from Streeting today suggest he has acknowledged a leadership battle will need to wait for the summer.

That's because Andy Burnham, Mayor of Manchester and favourite to become Labour leader, needs to be an MP in Westminster to be eligible to compete in a leadership contest. He has announced he'll be standing in Makerfield, a newly-vacated seat in the north of England, in a by-election that's likely to take place in the second half of June.

That in itself is no easy feat. Polls suggest that, in the absence of Burnham, Reform would win comfortably in Makerfield. Farage's party dominated the local elections in the area. Burnham will be banking on his local popularity to get him elected.

Assuming he does, that opens up a leadership contest that's likely to take place through the summer, with the results sewn up before the Labour Party conference in late September.

What gilt markets are watching

Until now, politics has not been the primary driver of gilt yields, which suggests there's still plenty of upside risk.

The Bank of England policy path has been lifted by higher oil prices over recent weeks. And we also have the Bank's Quantitative Tightening flooding the market with gilt supply at a pace of £70bn per year. Higher US Treasury yields, amidst very healthy US market sentiment, [is spilling over to gilt yields, too](#).

But as of Friday, there are signs that political uncertainty is starting to fuel those Bank of England rate hike expectations, too. Two rate hikes are priced by November and a third by March 2027. And even more interestingly, markets are not pricing in subsequent rate cuts over a two- or three-year horizon. Perceptions of the neutral rate – the level neither expansionary nor restrictive for the economy – have been repriced higher.

That tells us investors are most focused on the impact a leadership contest might have on Britain's fiscal trajectory, gilt issuance over the next couple of years, and its interplay with inflation. Burnham has said there's a case for exempting defence spending from the main fiscal rules, implying higher borrowing. Other Labour figures have flirted with extending the timeline of when the fiscal rules need to be met – which again makes it easier to boost borrowing in the near-term.

The biggest risk here is that investors begin to question the UK's longer-term fiscal discipline. Gilt markets rely on foreign investors and any signs that fiscal dynamics risk turning

unsustainable could quickly turn sentiment. We've already seen that the uncertainty around the Autumn Budget last November added a risk premium of around 25bp to 10Y gilts. Right now, we estimate the premium to be around 10bp, higher than a few weeks ago, but still less than around November's budget.

Until we get a better understanding around the fiscal path forward, political risk premium is likely to keep rising. A rise towards 5.30% is quite possible in the near term.

The reality might be different

With bond markets already under pressure, we suspect all leadership candidates will come until intense pressure to rule out big changes to the fiscal rules over the next few weeks. The memories of the 2022 mini-budget crisis haven't gone away.

We'd also note that fiscal changes are unlikely before the Autumn Budget. And until then, the Bank of England can only react to what is existing government policy. That suggests the leadership drama is unlikely to drastically alter the BoE's rate hiking path this summer.

Beyond politics, we also think Bank of England rate hike expectations look overblown. We expect one rate hike this year, but more importantly perhaps, a return to rate cuts in 2027. Once the near-term political noise has blown over, the direction for gilt yields is likely to be downwards across the medium term. We're forecasting the 10-year bond yield down to 4.5% through the middle of next year.

EUR/GBP versus 10-year gilt-bund spread

Source: Refinitiv, ING

Sterling is dragged into the sell-off

What has been noticeable over the last week is that sterling has finally been dragged into this political crisis. Up until recently, traded EUR/GBP volatility had been exceptionally low, near 4%, and the FX option market's view over its direction had not really changed much at all over the

last year. Now participants in the FX options market are prepared to pay 1.1% extra for the right to buy over the right to sell EUR/GBP over the next three months. That is virtually matching last year's 'Liberation Day' highs, when global equity markets were hit hard and the growth-sensitive pound fell 5% against the euro.

Behind that recent stability in the pound might have been the BoE's relatively high policy rate of 3.75% (helpful in a carry-seeking environment) and perhaps ongoing interest from M&A activity. Year-to-date pending and completed target acquisitions of UK companies are up over 100% this year, compared to around 20% for Europe as a whole.

Yet the focus now shifts to the long, hot summer of the Labour leadership crisis and the question is how far sterling could fall if international investors really turned bearish on the pound. Over the years, we have found our Financial Fair Value model as a useful vehicle to evaluate the size of risk premium that could emerge in EUR/GBP. The model looks at where EUR/GBP is actually trading versus where it might be trading were typical relationships with short-term rate differentials and equity performance to hold.

By our current reckoning, EUR/GBP is currently trading around 1% above fair value. As our chart below shows, EUR/GBP can trade as much as 5% over fair value in extreme conditions – such as in August 2019 when it looked like the UK would be leaving the EU without a deal. An extra 4% on EUR/GBP today warns that 0.90 is not out of the question this summer for EUR/GBP. For reference, the FX options market now attaches a 25% probability to EUR/GBP trading to 0.90 within the next three months.

Our baseline is for a slightly more modest advance in EUR/GBP to 0.88/89 in late summer – but the risks are clearly skewed to the upside.

EUR/GBP Financial Fair Value model

COMMODITIES, FOOD & AGRI ENERGY

Sitting, waiting, wishing... for energy flows to resume

Energy markets remain extremely sensitive to developments in the Middle East, showing the significance of the supply disruptions we are witnessing. However, there have been several factors that have helped to take some pressure off prices

With no imminent peace deal in sight, stalled Hormuz flows continue to hold Brent above \$100/bbl

Falling Chinese imports and rising US exports offer relief to oil markets

It has been another volatile month in energy markets, with oil prices being whipsawed by Iran-related headlines. Cold water has been thrown over optimism for an imminent peace deal, after President Trump rejected Iran's counterproposal peace plan. And as a result, any hopes for a quick resumption in energy flows through the Strait of Hormuz have also faded, which has seen Brent trade convincingly back above \$100/bbl.

However, with the oil market facing a supply disruption of around 13m b/d, one may be surprised that we are not seeing much higher prices. There is an element of the market still clinging to some optimism that energy flows may start picking up. However, there are some fundamental factors that have also helped. Chinese oil imports have fallen significantly, while

US oil exports hit record levels consistently in April, which has helped to take some of the upward pressure off the market. But these are temporary solutions. China will be relying on inventory as imports fall, while similarly the growth in US exports is fed by inventory rather than supply growth.

Another element which has contained the market is that we have already started to see demand destruction in the oil market. Crude oil prices have not had to go as high as many would imagine to drive this decline in demand. This can be largely attributed to the relative strength seen in refined product prices (gasoline, diesel, jet fuel), reflected by the widening in refined product margins. The significant strength in refined product prices has meant that crude oil prices have not had to go as high to ensure demand destruction.

While there is still plenty of uncertainty over how the situation plays out, we are assuming some recovery in oil flows in the remainder of the second quarter, allowing for nearer to normal flows in the third quarter. Under this scenario, Brent averages \$104/bbl in 2Q26 and US\$92/bbl in 4Q26. Clearly, though, every day that goes by without a resolution pushes the market towards a much more aggressive scenario.

Chinese oil imports fall while US oil exports surge amid Persian Gulf supply disruptions

Source: China Customs, EIA, ING Research

Demand destruction keeps the gas market in check... for now

While European gas prices are trading above pre-Iran war levels, they have come off significantly from their peak following the start of the war. We believe that gas markets are underpricing the scale of the supply disruption. The gas market has less of a buffer to weather supply shocks, while there is little in the way of alternative routes for Persian Gulf LNG to move to its destination, other than going through the Strait of Hormuz. While ship tracking data shows that Qatar has shipped its first two LNG cargoes since the start of the war, this falls far short of normal flows.

There is not enough slack in the LNG market to offset these supply losses, so the market will have to rely on inventory and demand destruction to try to balance, which is what we have been seeing. In Asia, gas-to-coal switching is occurring within the power sector, while industrial

demand is also coming under pressure. Meanwhile, relying on inventories means that buyers will have to come back to the market at a later stage to restock. The big upside risk for the market is if this restocking has to happen before energy flows through the Strait of Hormuz resume.

If we see Asian buyers coming into the spot LNG market to refill inventory/offset disrupted contracted volumes, this will increase competition between Europe and Asia for cargoes, which would push prices higher.

Gas storage in the EU is relatively tight, at 35% full compared to a five-year average of 48%. This will make the job of refilling storage tougher, especially as the TTF forward curve – currently in backwardation – does not incentivise storage. More flexibility in EU storage targets helps to take some pressure off the market heading into the 2026/27 winter. However, going into the winter with 75% full storage (which is the minimum allowed under extreme conditions) would leave the European market more vulnerable through the winter and risk higher prices.

CZECH REPUBLIC HUNGARY

Webinar: Directional Economics CEE – who breaks, who bends on Energy Shock 2.0

Join ING's CEE economists for a live webinar on 21 May, looking at how the region copes with the 2026 oil shock. We'll also be analysing the change of government in Hungary and what can be learned from Poland's political experience, plus whether CEE central banks are about to make a policy mistake in reacting to inflation. [Sign up here](#)

The oil shock is a macro stress test for the CEE region

Source: Shutterstock

The oil shock that began in March isn't just another commodity move; it's a macro stress test for the CEE region at a time when disinflation was maturing, fiscal space was narrow, and demand was largely fragile. The differences that matter most aren't how much oil a country imports, but who has the institutional shock absorbers to manage the blow.

Join ING's CEE economists for a live webinar examining the fall out on the region from higher energy prices.

You'll learn:

- Which countries entered into this shock in a better position

THINK economic and financial analysis

- Where the structural burden of high oil prices will be felt the most.
- What policy changes can and cannot do
- The spillover to the CIS economies, through external buffers and currencies

Moving away from energy and into politics, we'll also be looking at the challenges facing the new Tisza government in Hungary and what it can learn from Poland's Civic Platform which returned to power in 2023.

And we'll be wrapping up with a look across the region at whether any central bank tightening into this inflation shock would represent a policy mistake.

This webinar will follow the publication of the latest Directional Economics, complete with updated forecasts and analysis of the CEE economies.

Details

Date: Thursday 21 May

Time: 1300 BST/1400 CEST

The webinar will last 60 minutes, including a Q&A session at the end.

The event will take place online and the waiting room will open 60 minutes ahead of the scheduled start time.

A joining link will be emailed following registration, and you will receive a reminder email 10 minutes before the scheduled start time.
