

摘要：

SemiAnalysis发布关于英伟达削减内存容量的报告，被市场解读为AI需求降温，导致美光在获英伟达HBM4认证的同日股价重挫13%，创2025年4月以来最大单日跌幅。该机构虽否认看空，但因其屡次发布看空美光的误导性叙事且频遭基本面“打脸”，正引发市场对其研究质量的强烈质疑。

一份来自半导体研究机构SemiAnalysis的报告，再度成为美光科技股价单日重挫的导火索。

周五，美光股价收跌13%，创下2025年4月以来最大单日跌幅，而这已是SemiAnalysis多次发布看空美光相关报告后引发市场恐慌的最新一例。

本次下跌的直接触发点，是SemiAnalysis发布报告称，**英伟达已将其下一代Vera Rubin服务器机架的模块化内存容量从55TB大幅削减至28TB**，市场将此解读为AI内存需求降温的信号。

消息一出，美光股价当日重挫，[半导体板块全线承压](#)，三大股指悉数收跌。值得注意的是，就在同一天，英伟达CEO黄仁勋公开宣布，美光已与SK海力士、三星一同通过英伟达HBM4认证，成为最新一代高带宽内存的合格供应商。

然而，利好消息未能抵挡报告引发的抛售浪潮。SemiAnalysis随后在社交平台X上发文回应，称其分析“并无任何看空之处”，但这一辩解在市场上几乎未能引发任何反转。

与此同时，多位市场人士和网友对SemiAnalysis的研究质量及信息传播方式提出强烈质疑，认为该机构已多次以“深度研究”之名制造看空美光的叙事，却屡屡被股价走势和公司基本面所打脸。

利好与利空同日上演，美光单日重挫13%

周五对美光而言是矛盾的一天。

黄仁勋在公开场合确认，**美光已与SK海力士和三星并列，成为英伟达HBM4认证供应商。**

华尔街分析师此前普遍预期英伟达将采用三家供应商，但KeyBanc分析师John Vinh曾指出SK海力士和美光在满足英伟达标准方面存在一定问题。因此，此次官方认证对美光而言本应是重大利好。

然而，美光股价当日仍收跌13%，报864.01美元，为2025年4月以来最大单日跌幅。叠加周四7.7%的跌幅，美光两日累计跌幅已超过20%。

据道琼斯市场数据，此前美光股价在过去12个月内累计涨幅超过735%，高估值令其对任何获利回吐行为都极为敏感。

SemiAnalysis报告的核心争议：模块化内存还是HBM？

本次引发市场波动的SemiAnalysis报告，核心内容是**英伟达削减了Vera Rubin服务器机架的模块化内存（SOCAMM DRAM）容量。**

需要指出的是，模块化内存与驱动AI服务器内存芯片需求的高带宽内存（HBM）是两个不同的产品类别。SemiAnalysis创始人Dylan Patel随后发文澄清，称该机构的分析“并无任何看空之处”。

据巴伦周刊报道，英伟达削减模块化内存容量，实际上可能反映的是HBM挤出效应正在发生——由于HBM生产极为耗费晶圆产能（每单位HBM所需晶圆产能约为标准内存的三倍），HBM供应扩张必然压缩其他内存类型的产能，并推高整个内存行业的价格。

研究机构Trendforce的分析师写道：

"随着HBM技术代际在2027年持续演进，芯片尺寸扩大与需求同步上升，对传统DRAM产能的挤出效应预计将进一步加剧。这将为供应商提供充分理由上调HBM价格，并强化其在明年HBM谈判中的定价权。"

屡次"看空"屡次被打脸，SemiAnalysis成争议焦点

此次事件并非SemiAnalysis第一次因涉及美光的报告引发市场波动，也并非第一次事后被证明方向有误。

社交平台X用户@Klaytonlolus整理了SemiAnalysis过去数月内多次发布看空美光相关报告的时间线：

- **1月初**，SemiAnalysis称美光HBM4样品引脚速度偏弱，落后于SK海力士和三星。彼时美光股价约430美元，此后涨至920美元以上，涨幅逾114%。
- **1月28日**，SemiAnalysis称英伟达Rubin首年HBM4订单"看不到美光的身影"。彼时美光股价435.28美元，此后同样涨至920美元以上，涨幅逾111%。
- **2月6日**，SemiAnalysis发布最具影响力的一篇报告，称美光在Rubin首个12个月内的HBM4份额"基本归零"。彼时美光股价394.69美元，此后涨至920美元以上，涨幅逾133%；若从3月低点321美元算起，涨幅更超186%。

- 6月4日至5日，SemiAnalysis再度发布报告，称英伟达削减Vera Rubin CPU侧SOCAMM DRAM容量，暗示内存需求降温。美光6月4日收于996美元，次日跌至920美元附近，单日跌幅约7.5%。

SemiAnalysis calling MU bearish in 2026 has basically gone beyond “bad analysis.”

At this point, it is becoming low-grade, amateur-hour counter-signal material.

Just look at the numbers.

Early January

They said Micron’s HBM4 sample pin speed looked weak and was falling behind SK Hynix / Samsung.

MU was around \$430 at the time. Now it is \$920+. Up more than 114%.

January 28

They said Nvidia Rubin’s first-year HBM4 orders showed “no Micron visibility.”

MU was \$435.28 at the time. Now it is \$920+. Up more than 111%.

February 6 — the big one

They claimed Micron’s HBM4 share in the first 12 months of Rubin was basically cut to zero.

MU was \$394.69 at the time. Now it is \$920+. Up more than 133%.

From the March low of \$321, MU is up more than 186%.

June 4–5

Now they are pushing another narrative: NVDA allegedly cut Vera CPU-side SOCAMM DRAM from 55TB to 28TB, implying memory demand is cooling.

MU closed at \$996 on June 4 and dropped to \$920+ on June 5, down 7.5% in one day.

But even after that drop, MU is still 133% higher than when they published the February “Micron has no share” piece.

This is no longer just “getting one call wrong.”

This is repeatedly using a very confident tone, dressing up supply-chain storytelling as deep industry research, and then getting slapped in the face by the stock price, fundamentals, and the AI memory supercycle.

The problem with SemiAnalysis is not that they are bearish. Being bearish is fine. Being skeptical is fine. The problem is that they keep framing Micron as if it is being pushed out of HBM4, while MU has gone from the low \$300s to over \$900.

With that level of accuracy, maybe stop branding it as “deep research.” To put it bluntly, this looks more like a low-grade amateur counter-indicator wearing a professional costume.

Every time SemiAnalysis comes out to trash MU, the market gets scared for a minute. Long term, it has basically been free shares handed to us. [@SemiAnalysis_](#)

Klaytonlolus在帖子中写道：

"这已经不只是'一次判断失误'的问题。这是反复以极度自信的语气，将供应链故事包装成深度行业研究，然后被股价、基本面和AI内存超级周期狠狠打脸。"

SemiAnalysis回应：信息不对称之争

面对外界批评，SemiAnalysis回应称，其报告的真实结论是“美光HBM延迟对美光而言是利好，因为普通DDR的利润率高于HBM”，并表示批评者根本没有读过完整报告，“那些这么说的人甚至没有订阅权限”。

SemiAnalysis @SemiAnalysis_ · 23小时

显示翻译

Where did we say bearish MU? The note on their HBM delay literally said it was good because regular DDR margins are higher than HBM. But you wouldn't know that because you didn't actually read our note.

然而，这一回应本身也引发了新的争议。用户Vinit Baliyan质问道：

"为什么你们不能向更广泛的订阅用户分享这类信息？你们是否在向机构客户提供准确信息，同时让普通订阅者和散户陷入困惑？这实际上是在给你们的富有客户提供不对称优势，代价是散户投资者的利益。"

Vinit Baliyan @baliyan_vinit · 12小时

...

Why can't you share that kind of information to your broader subscription? Do you hate retail investors? People who subscribe to you were confused every time.

...

It's actually far worse than you give accurate information to "institutions" and confuse your broader subscribers/retail. Isn't that like giving an asymmetric advantage to your rich pals (at the cost of retail)? Change your firm name to reverse robinhood!

66

另一位用户Klaytonlolus则指出，SemiAnalysis的报告被多家媒体广泛引用，核心信息被解读为“英伟达未向美光下达HBM4订单”，这是明确的看空框架。美光CFO随后公开反驳“不准确的报道”，称HBM4已进入大规模量产阶段，客户出货已经开始，且量产节奏比此前预期提前了一个季度。美光随后正式宣布HBM4 36GB 12H进入大规模量产，专为英伟达Vera Rubin设计，带宽超过2.8 TB/s，能效提升逾20%。

Klaytonlolus写道，“问题不在于读者是否读了完整报告，问题在于你们的标题、摘要和框架制造了明确的看空美光叙事，而这一叙事后来被美光管理层和官方产品公告所推翻。这不是‘深度研究’，这是不负责任的框架，加上事后的危机公关。”

Korea119 @Klaytonlolus · 22小时

...

You can't rewrite history now.

Your note was widely reported as SemiAnalysis cutting Micron's expected Nvidia Rubin HBM4 share to ZERO. Multiple outlets quoted the core message: "we currently do not see indications of Nvidia ordering Micron HBM4."

That is bearish framing. Full stop.

If your real conclusion was "this is good for MU because DDR margins are higher," then why did the market, the media, and investors all read it as a Micron HBM4 exclusion story?

More importantly, Micron's own CFO later pushed back against "inaccurate reports," said HBM4 was already in high-volume production, customer shipments had begun, and the ramp was happening one quarter earlier than previously expected.

Then Micron officially announced HBM4 36GB 12H in high-volume production, designed for NVIDIA Vera Rubin, with >2.8 TB/s bandwidth and >20% better power efficiency.

So the issue is not whether people read your full note. The issue is your headline/snippet/framing created a clear bearish MU narrative that later got contradicted by Micron management and Micron's official product announcement.

That's not "deep research."
That's irresponsible framing followed by damage control.

尽管批评声浪不小，SemiAnalysis在业内仍有一定支持者。

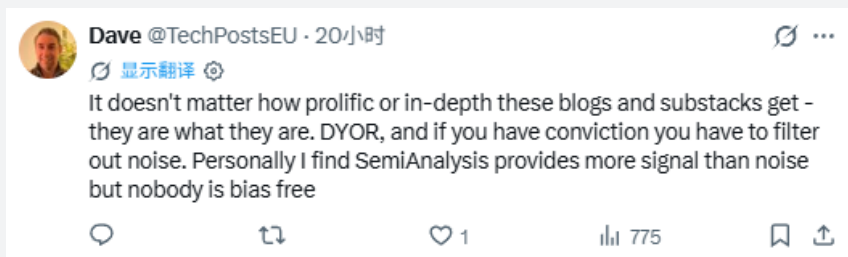

付费订阅用户“Macho Man Randy Newman”表示，

SemiAnalysis的深度报告帮助他在内存股已大幅上涨后仍坚定持仓，目前其美光持仓已实现22倍回报。他认为，SemiAnalysis提供的是详细的事实性报道，但其编辑性结论则需要读者自行判断。

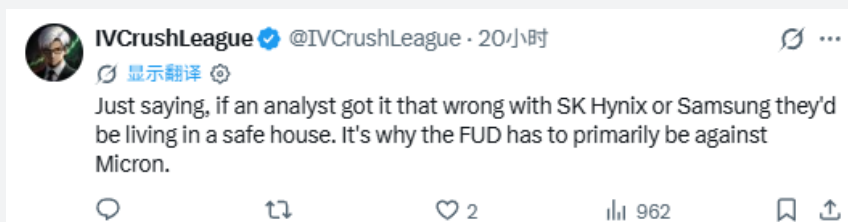

用户Dave则持中立立场：

"无论这些博客和Substack写得多么详尽，它们终究只是它们本身。做好自己的研究，如果你有信念，就必须过滤掉噪音。我个人认为SemiAnalysis提供的信号多于噪音，但没有人是没有偏见的。"

也有用户将矛头指向更深层的市场结构问题。用户IVCrushLeague评论道：

"如果一位分析师对SK海力士或三星的判断出错到这种程度，他们早就要躲起来了。这也是为什么这类恐慌性信息主要针对美光。"
