Higher rates, wider spreads, steeper curves, hyperscaler fatigue and a more volatile backdrop should see corporate supply ease modestly from record highs. We forecast €444bn of supply in 2027

Issuance challenges

2026 is set to be a record year for euro supply at €485bn. Elevated redemptions, capex, M&A, ALM activity, hybrid issuance and, of course, the heavy reverse Yankee supply, particularly from US tech issuers, have all supported issuance volumes.

Looking to 2027, many of these drivers remain in place, but higher rates, slightly wider spreads, steeper curves, hyperscaler fatigue and a more volatile backdrop should see supply slow modestly from record highs.

As such, we expect supply to fall back to €444bn in 2027, approximately 8.5% lower than 2026's record level. That would bring issuance back in line with the €444bn seen in 2020 and close to the €455bn printed in 2025. More importantly, it would mark the first decline in net supply in several years, providing a more supportive technical backdrop for credit spreads. Net supply is pencilled in at €126bn after redemptions rise up to €318bn.

Corporate supply to fall to €444bn

end of the curve. The broader message, however, is that rates should remain elevated enough to keep all-in yields attractive.

We expect only limited changes in outright rates, curve shape and swap spreads, leaving all-in yields broadly intact. As a result, the search for yield should remain a powerful tailwind for credit markets throughout 2027, although the same elevated rates continue to increase the cost of debt for issuers.

All-in yield for credit rises
