AT1 reform may remain on the back burner in 2027, leaving the instruments' role in bank capital largely unchanged. Solid fundamentals remain supportive, while supply should be manageable – but tight(ish) spreads and low reset levels could weigh on the market

AT1 reform remains on the back burner

The European Commission published its report on competitiveness in the banking sector in July but did not include much in the way of proposals for AT1 bank capital instruments. The report mainly focused on reducing complexity, reporting requirements and improving competitiveness for Europe's banking sector.

For AT1, this probably means that the instruments are unlikely to be phased out anytime soon. What is somewhat relevant for AT1s is the Commission's intention to reduce complexity for bank capital structures. This includes making the Pillar 2 requirement and

guidance more transparent, while the Commission also proposes to consolidate parts of the buffers into two buffers: one that can be released in periods of stress, and another that would be maintained in all scenarios.

This, in theory, could reduce the risk of coupon skips, as being able to release buffers during periods of stress would not automatically lead to a breach of the combined buffer requirements. The proposals also include a removal of the leverage ratio Pillar 2 capital requirement, which would affect the largest European systemically important banks subject to this requirement. This is only a small number of banks but could (in theory) lead to a marginal decline in A

line with expectations in 2026. EUR AT1 issuance has just passed €15bn at the time of writing, slightly above our expectation of €15bn. Similarly, EUR Tier 2 has reached €27bn, nearing our expectation of €30bn for 2026.

In 2027, we expect a modest increase in supply, largely dominated by the refinancing of upcoming redemptions/calls. We expect **€20bn in AT1 supply**, compared to €14bn of calls. While this represents a step-up, incremental net supply is only around €3bn higher than in 2026. Tier 2 redemptions will also rise by around

€3bn next year, supporting our increased supply expectation of **€35bn in Tier 2.**

While gross supply will be higher, net supply should remain easily absorbable. More supply should create opportunities in primary markets, although lower reset levels have left some recently issued bonds more exposed during weaker markets.

AT1 redemptions pick up next year

highest level since 2002. The story in French markets is growing more sinister by the day. But contagion risk across the eurozone is (so far) relatively contained. Italy and Belgium stand out as other higher-risk countries, given high debt levels and deficits, but it remains a French story for now. Nonetheless, the domestic sovereign exposure and the sovereign-bank nexus have come back into play.

So far, the market is not questioning the broader future of the eurozone. Still, France is of a much larger magnitude than countries

such as Greece or even Italy, which had to be supported during the eurozone crisis.

What can be said is that French banks, as well as the broader European banking sector, are in much better shape than they were during the eurozone crisis. French banks' capital ratios have increased significantly and now stand at around 13-15% on average, compared to c.9-10% during the eurozone crisis. Liquidity levels are healthy, while earnings and exposures, particularly for the larger banks, are well diversified. For instance, BNP Paribas generated around 25% of its revenues in 2025 in France, while French deposits account for 29% of the total. For Société Générale, F

However, we do not think this is the same sovereign-bank loop as in 2009-2012. European Central Bank funding facilities, the Bank Recovery and Resolution Directive (BRRD) and stronger liquidity coverage ratio (LCR) and net stable funding ratio (NSFR) requirements have reduced banks' dependence on sovereign guarantees. The link remains: ratings, domestic bond holdings and a shared operating environment still transmit sovereign stress into bank funding costs and market access.

The flip side is that liquidity requirements and favourable EU sovereign risk weights have made banks important buyers of government debt. As ECB purchases ended and TLTROs were repaid, sovereign holdings have partly replaced central bank reserves for LCR purposes. Banks rely less on sovereign guarantees, but on the other hand, sovereigns arguably rely more on banks for funding.

This new relationship, alongside expectations that the ECB would contain broader spillovers, perhaps helps explain why bank spreads have not widened as much as OATs. The ECB's refinancing and bond purchase tools remain part of the toolkit, although they have p

We would avoid treating all French banks similarly. Sensitivity to OATs and the French economy differ quite a bit across issuers. As such, the recent widening has been quite uniform, but the market could become more selective in French AT1s if nervousness continues into 2027. We think the most diversified names, including BNP and ACAFP in short-call bonds, with high reset levels, should hold up better.

French AT1 spreads trade at the widest levels in EUR

This is especially the case as the reset levels remain low, while overall coupon levels are in line with recent historical averages. **The economics become less comfortable further out**. Reset spreads decline for bonds callable from 2030 onwards, leaving these bonds

more sensitive to higher rates and deterioration in market access. However, reset levels remain high on average through to 2029 callable bonds.

AT1 coupons have declined, but still remain elevated

points.

Reset has mattered more than ratings

High reset spread AT1s have generally been more resilient in 2026, with the 700-800bp reset bucket outperforming by quite a bit over the last three months. While this relationship is not fully linear, and many high-reset bonds are issued by higher beta/lower rated issuers, numbers still suggest that reset levels have been an important driver of performance this year. Higher underlying rates reduce the cushion that lower reset AT1 bonds have had, as

extension risk concerns have made more of a comeback in recent months.

Higher reset levels also provide greater coupon protection if a bond is extended during a period of market stress. There are a few near-term low-reset bonds callable with reset levels below +380bp. However, extension risk is still low for these: longer-call AT1s from these issuers trade through the respective reset levels, and these banks have historically assessed calls holistically, rather than purely on an economics or bond-by-bond basis.

Higher-rated bonds have underperformed in 2026. IG-rated bonds h

So where does that leave the AT1 market in 2027?

2027 is shaping up to be another interesting year for bank capital. Valuations look a bit compressed, but bank fundamentals remain solid, with banks likely to continue calling their instruments at the first call dates. In terms of supply, we expect the small increase to be absorbable but potentially lead to investors becoming a bit more price sensitive. Furthermore, the lack of imminent AT1 reform

should mean the asset class retains an important role in Europe's banking capital stacks for the foreseeable future.

There are risks becoming more visible, not least through sovereign and fiscal concerns, with France the obvious victim at the moment. A softening of fundamentals at the margin and lower reset levels further along the call curve could create more volatility. Spreads have recently seen some widening, yet there is probably greater scope for spreads to stay wider than for further tightening in 2027.

AT1 yields could remain a good driver of demand for
